National Acid Rain Program

CHAPTER 11

Section 1. Introduction to national acid rain program.

(a) Chapter 11 sets forth requirements established in title IV of the 1990 Clean Air Act Amendments. The national acid rain program is a program to reduce sulfur dioxide and nitrogen oxide emissions through a federally implemented, market-based approach for controlling air pollution.

Section 2. Acid rain program.

(a) General: The U.S. Environmental Protection Agency regulations on Acid Rain designated in Chapter 11, Section 2(b) are incorporated by reference into these regulations.

(b) Acid Rain Program Regulations: The following Acid Rain Program Regulations found in 40 CFR parts 72 - 78, revised and published as of July 1, 2008, not including any later amendments, are adopted and incorporated by reference. Copies of Acid Rain Program Regulations are available for public inspection and copies can be obtained at cost from the Department of Environmental Quality, Division of Air Quality, 122 W. 25th Street, Cheyenne, Wyoming 82002.

Permitting Requirements

CHAPTER 6

Section 1. Introduction to permitting requirements.

(a) Chapter 6 establishes permitting requirements for all sources constructing and/or operating in the State of Wyoming. Section 2 covers general air quality permitting requirements for construction and modification as well as minor source permits to operate. Section 3 is the state operating permit program required under Title V of the Clean Air Act. Section 4 is the prevention of significant deterioration (PSD) program. Section 5 covers permitting requirements for major sources of hazardous air pollutants for which a MACT (maximum achievable control technology) standard has been established under section 112 of the Clean Air Act. Section 6 covers permitting requirements for major sources of hazardous air pollutants for which a MACT standard has not been established under section 112 of the Clean Air Act. Section 7 establishes the terms under which clean air resource allocations expire. Section 8 is reserved. Section 9 establishes Best Available Retrofit Technology (BART) requirements and provides guidelines for identifying sources subject to BART. Sections 10, 11 and 12 are reserved. Section 13 incorporates by reference 40 CFR part 51.165, nonattainment permit requirements. Section 14 incorporates by reference all Code of Federal Regulations (CFRs) cited in this chapter, including their Appendices.

Section 2. Permit requirements for construction, modification, and operation.

(a) (i) Any person who plans to construct any new facility or source, modify any existing facility or source, or to engage in the use of which may cause the issuance of or an increase in the issuance of air contaminants into the air of this state shall obtain a construction permit from the State of Wyoming, Department of Environmental Quality before any actual work is begun on the facility.

(ii) Any facility or source required to obtain a permit for construction or modification under this section must, if subject to the provisions of Chapter 6, Section 3 of these regulations, submit an application to the Division for a Chapter 6, Section 3 operating permit within twelve (12) months of commencing operation.

(iii) Facilities or sources not subject to the provisions of Chapter 6, Section 3 of these regulations shall obtain a Chapter 6, Section 2 operating permit from the Department, pursuant to this section, for operation after a 120-day start-up period.

(iv) A permit to operate is also required for the operation of an existing portable source in each new location. However, a permit to construct is required for each new location that is a new source or facility and for each new or modified portable source or facility.

(v) Permit Fees: Persons applying for a permit under this section, or waiver from permit requirements under Chapter 6, Section 2(k)(viii), shall pay a fee to cover the Department's cost of reviewing and acting on permit applications in accordance with paragraph (o) of this section.

(vi) Facilities or sources subject to the provisions of Chapter 6, Section 5 or Chapter 6, Section 6 shall submit the permit application as required by Chapter 6, Section 5(a)(iii) or by Chapter 6, Section 6(h)(iv) as part of the permit application submitted in accordance with Chapter 6, Section 2(b)(i).

(b) (i) The owner of the facility or the operator of the facility authorized to act for the owner is responsible for applying for and obtaining a permit to construct and/or operate. The application shall be made on forms provided by the Division of Air Quality and each application shall be accompanied by site information, plans descriptions, specifications, and drawings showing the design of the source, the nature and amount of the emissions, and the manner in which it will be operated and controlled. A detailed schedule for the construction or modification of the facility shall be included. A separate application is required for each source. Any additional information, plans, specifications, evidence, or documentation that the Administrator of the Division of Air Quality may require shall be furnished upon request. The applicant shall conduct such continuous Ambient Air Quality monitoring analyses as may be determined by the Administrator to be necessary in order to assure that adequate data are available for purposes of establishing existing concentration levels of all affected pollutants. As a guideline, such data should be gathered continuously over a period of one calendar year preceding the date of application. Upon petition of the applicant, the Administrator will review the proposed monitoring programs and advise the applicant if such is approvable or modifications are required.

(ii) For portable sources or facilities, the Division may authorize the owner or operator to utilize a "self issuance" operating permit system for new locations which are not new sources or facilities. For purposes of this paragraph, a new source or facility is a source or facility for which operation or construction commenced after May 29, 1974, and for which a permit has not previously been issued.

The Division shall provide to authorized owners or operators of portable sources, forms upon which the self-issued permits are to be recorded. The owner or operator shall, at a minimum provide, as appropriate the permit number previously issued to the portable source or facility, the new location for which the permit is issued, the duration of

operation of the new location, the production rate at the new location and the production at the new location in addition to any other information that the Administrator may require. Such permit shall be executed and a copy provided to the Air Quality Division prior to operation at the new location.

All conditions previously issued for the operation of the portable facility continue as applicable conditions for operation at subsequent locations.

(c) No approval to construct or modify shall be granted unless the applicant shows, to the satisfaction of the Administrator of the Division of Air Quality that:

(i) The proposed facility will comply with all rules and regulations of the Wyoming Department of Environmental Quality, Division of Air Quality, and with the intent of the Wyoming Environmental Quality Act.

(ii) The proposed facility will not prevent the attainment or maintenance of any ambient air quality standard.

(A) A facility will be considered to cause or contribute to a violation of an ambient air quality standard if the projected impact of emissions from the facility exceed the following significance levels at any locality that does not or would not meet the applicable standard:

POLLUTANT	AVERAGING TIME (HOURS)				
	ANNUAL ($\mu\text{g}/\text{m}^3$)	24 ($\mu\text{g}/\text{m}^3$)	8 (mg/m^3)	3 ($\mu\text{g}/\text{m}^3$)	1 (mg/m^3)
SO ₂	1.0	5	---	²⁵	---
PM ₁₀	1.0	5	---	---	---
NO _x	1.0	---	---	---	---
CO	---	---	0.5	---	2

(B) Notwithstanding the provisions of Chapter 6, Section 2(c)(ii)(A) above, no facility with the potential to emit 100 tons per year or more of PM₁₀ (including sources of fugitive dust) shall be allowed to construct within the City of Sheridan designated PM₁₀ nonattainment area until such time as the area is redesignated to an attainment area for PM₁₀ ambient standards in accordance with section 107 of the Clean Air Act. In addition, no existing facility with the potential to emit 100 TPY or more of PM₁₀ within the Sheridan designated PM₁₀ nonattainment area shall be allowed to modify operations to increase potential PM₁₀ emissions by 15 tons per year or more (including sources of fugitive dust), until such time as the area is redesignated by EPA as an attainment area for PM₁₀ ambient standards. For the purpose of this paragraph, “potential to emit” shall have the same meaning as in Chapter 6, Section 4.

(iii) The proposed facility will not cause significant deterioration of existing ambient air quality in the Region as defined by any Wyoming standard or regulation that might address significant deterioration.

(iv) The proposed facility will be located in accordance with proper land use planning as determined by the appropriate state or local agency charged with such responsibility.

(v) The proposed facility will utilize the Best Available Control Technology with consideration of the technical practicability and economic reasonableness of reducing or eliminating the emissions resulting from the facility. For large mining operations, specific measures normally required and to be considered include but are not limited to:

- (A) The paving of access roads;
- (B) The treating of major haul roads with a suitable dust suppressant;
- (C) The treatment of temporary haul roads;
- (D) The use of silos, trough barns, or similar enclosed containers for the storage of large volumes of material awaiting load out and shipment;
- (E) The treatment of active work areas; and
- (F) The treatment of temporary ore stockpiles.

(vi) The proposed facility will have provisions for measuring the emissions of significant air contaminants as determined by the Administrator of the Division of Air Quality.

(vii) The proposed facility will achieve the performance specified in the application for the permit to construct or modify.

(viii) The proposed facility will not emit any air pollutant in amounts which will (i) prevent attainment or maintenance by any other state of any such national primary or secondary Ambient Air Quality Standard or (ii) interfere with measures required by the Federal Clean Air Act to be included in the applicable Implementation Plan for any other state to prevent significant deterioration of air quality or to protect visibility.

(d) In meeting the requirements of Chapter 6, Section 2(c) above pertaining to compliance with an applicable Ambient Air Quality Standard or increment, the degree of

emission limitation required shall not be affected by (a) so much of the stack height of any source as exceeds good engineering practice stack height or (b) any other dispersion technique.

(i) For purposes of this requirement, “good engineering practice stack height” means the height equal to or less than:

(A) 30 meters as measured from the ground-level elevation at the base of the stack, or

(B) $H + 1.5L$ where H is the height of nearby structure(s) measured from the ground level elevation at the base of the stack and L is the lesser dimension (height or width) of, the source, or nearby structure, provided that the Administrator may require the use of a field study or fluid model to verify good engineering practice stack height for the source, or

(C) Such other height as is demonstrated by a fluid model or a field study approved by the Administrator, which ensures that emissions from a stack do not result in excessive concentrations in the immediate vicinity of the source as a result of atmospheric downwash, eddies, or wakes which may be created by the source, nearby structures or nearby terrain features.

(ii) For purposes of this requirement, “dispersion technique” means any technique which attempts to affect the concentration of a pollutant in the ambient air by:

(A) Using that portion of a stack which exceeds good engineering practice stack height, or

(B) Varying the rate of emission of a pollutant according to atmospheric conditions or ambient concentrations of that pollutant, or

(C) Increasing the final exhaust gas plume rise by manipulating source process parameters, exhaust gas parameters, stack parameters, or combining exhaust gases from several existing stacks into one stack, or other selective manipulation of exhaust gas streams so as to increase the exhaust gas plume rise.

(iii) For purposes of this requirement, “dispersion technique” does not include:

(A) The reheating of a gas stream, following use of a pollution control system, for the purpose of returning the gas to the temperature at which it was originally discharged from the facility generating the gas stream, or

(B) The merging of exhaust gas streams where the source owner or operator demonstrates that the facility was originally designed and constructed with such merged streams.

(iv) For the purposes of this requirement, “emission limitation” means a requirement established by the Administrator which limits the quantity, rate, or concentration of emissions of air pollutants on a continuous basis, including any requirements which limit the level of opacity, prescribe equipment, set fuel specifications, or prescribe operation or maintenance procedures for a source to assure continuous emission reduction.

(v) “Nearby” as used in Chapter 6, Section 2(d)(i) is defined for a specific structure or terrain feature, and

(A) For purposes of applying the formula provided in Chapter 6, Section 2(d)(i)(B) means that distance up to five times the lesser of the height or the width dimension of a structure, but not greater than one half mile (0.8 km), and

(B) For conducting demonstrations under Chapter 6, Section 2(d)(i)(C) means not greater than one half mile (0.8 km), except that the portion of a terrain feature may be considered to be nearby which falls within a distance of up to 10 times the maximum height of the feature, not to exceed 2 miles if such feature achieves a height one half mile from the stack that is at least 40 percent of the GEP stack height determined by the formula provided in Chapter 6, Section 2(d)(i)(B) or 26 meters, whichever is greater, as measured from the ground-level elevation at the base of the stack. The height of the structure of terrain feature is measured from the ground-level elevation at the base of the stack.

(vi) “**Excessive concentration**” is defined for the purpose of determining good engineering practice stack height under Chapter 6, Section 2(d)(i)(C) and means,

(A) For sources seeking credit for stack height exceeding that established under Chapter 6, Section 2(d)(i)(B), a maximum ground-level concentration due to emissions from a stack due in whole or part to downwash, wakes, and eddy effects produced by nearby structures or nearby terrain features which individually is at least 40 percent in excess of the maximum concentration experienced in the absence of such downwash, wakes, or eddy effects and which contributes to a total concentration due to emissions from all sources that is greater than an ambient air quality standard. For sources subject to the prevention of significant deterioration (Chapter 6, Section 4), an excessive concentration alternatively means a maximum ground-level concentration due to emissions from a stack due in whole or part to downwash, wakes, or eddy effects produced by nearby structures or nearby terrain features which individually is at least 40 percent in excess of the maximum concentration experienced in the absence of such downwash, wakes, or eddy effects and greater than a prevention of significant

deterioration increment. The allowable emission rate to be used in making demonstrations under this section shall be prescribed by the new source performance standard that is applicable to the source category unless the owner or operator demonstrates that this emission rate is infeasible. Where such demonstrations are approved by the Administrator, an alternative emission rate shall be established in consultation with the source owner or operator.

(vii) After the Administrator has reached a proposed decision to approve or disapprove a permit application in which the source relies on a good engineering practice stack height that exceeds the height allowed by Chapter 6, Section 2(d)(i)(A) or (B) the Administrator will notify the public of the availability of the demonstration study and provide the opportunity for public hearing. Specific notification of the Administrator's decision, availability of the demonstration and opportunity for public hearing will be included as part of the public notice required in Chapter 6, Section 2(m) of these regulations.

(e) No permit to operate may be granted until the applicant demonstrates to the satisfaction of the Administrator of the Division of Air Quality that:

(i) The facility is complying with the Wyoming Air Quality Standards and Regulations applicable at the time the permit to construct or modify was granted and with the intent of the Wyoming Environmental Quality Act, 1973.

(ii) The facility has been constructed or modified in accordance with the requirements and conditions contained in the permit to construct or modify.

(f) The Administrator of the Division of Air Quality may impose any reasonable conditions upon an approval to construct, modify, or operate including, but not limited to, conditions requiring the source to be provided with:

(i) Sampling and testing facilities as the Administrator may require;

(ii) Safe access to the sampling facilities;

(iii) Instrumentation to monitor and record emission data; and

(iv) Ambient Air Quality monitoring which, in the judgment of the Administrator, is necessary to determine the effect which emissions from a source may have, or is having, on air quality in any area which may be affected by emissions from such source.

(g) The Administrator will review each application within 30 days and notify the applicant as to whether or not the application is complete. If the application is complete, the Administrator will propose approval, conditional approval or denial and will publish

such proposal within 60 days of the determination that the application is complete. If the application is not complete, the application will be considered inactive and additional information as necessary will be requested. A complete application shall include all materials and analyses which the Administrator determines are necessary for the Division to review the facility as a source of air pollution.

(h) A permit to construct or modify shall remain in effect until the permit to operate the facility for which the application was filed is granted or denied or the application is canceled. However, an approval to construct or modify shall become invalid if construction is not commenced within 24 months after receipt of such approval or if construction is discontinued for a period of 24 months or more. The Administrator may extend such time period(s) upon a satisfactory showing that an extension is justified. This provision does not apply to the time period between construction of the approved phases of a phased construction project; however, each phase must commence construction within 24 months of the projected and approved commencement date for such phase. Notwithstanding the above, a permit containing a case-by-case MACT determination pursuant to Chapter 6, Section 6 shall expire if construction or reconstruction has not commenced within 18 months of issuance, unless the Division has granted an extension which shall not exceed an additional 12 months.

(i) Any owner or operator subject to the provisions of this regulation shall furnish the Administrator written notification as follows:

(i) A notification of the anticipated date of initial start-up of each source not more than 60 days or less than 30 days prior to such date.

(ii) A notification of the actual date of initial start-up of each source within 15 days after such date.

(j) Within 30 days after achieving the maximum design production rate for which the permit is approved and at which each source will be operated, but not later than 90 days after initial start-up of such source, the owner or operator of such source shall conduct a performance test(s) in accordance with methods and under operating conditions approved by the Administrator and furnish the Administrator a written report of the results of each performance test.

(i) Such test shall be at the expense of the owner or operator.

(ii) The Administrator may monitor such test and may also conduct performance tests.

(iii) The owner or operator of a source shall provide the Administrator 15 days prior notice of the performance test to afford the Administrator the opportunity to have an observer present.

(iv) The Administrator may waive the requirement for performance tests if the owner or operator of a source has demonstrated by other means to the Administrator's satisfaction that the source is being operated in compliance with all State and Federal Regulations which are part of the applicable plan.

(v) If the maximum design production rate for which the permit is approved is not achieved within 90 days of initial start-up, testing will be conducted on a schedule to be defined by the Administrator. This schedule may require that the source be tested at the production rate achieved within 90 days of initial start-up and again when maximum design production rate is achieved.

(k) Approval to construct or modify shall not be required for:

(i) The installation or alteration of an air pollutant detector, air pollutants recorder, combustion controller, or combustion shutoff.

(ii) Air conditioning or ventilating systems not designed to remove air pollutants generated by or released from equipment.

(iii) Fuel burning equipment other than a smokehouse generator which has a heat input of not more than 25 million BTU per hour (6.25 billion gm-cal/hr) and burns only gaseous fuel containing not more than 20 grains total sulfur per 100 std. ft³; has a heat input of not more than 10 million BTU/hr (2.5 billion gm-cal/hr) and burns any other fuel.

(iv) Mobile internal combustion engines.

(v) Laboratory equipment used exclusively for chemical or physical analyses.

(vi) The installation of air pollution control equipment which is not a part of a project which requires a construction or modification permit under Chapter 6, Section 2 or 4 of these regulations.

(vii) Gasoline storage tanks at retail establishments.

(viii) Such other minor sources which the Administrator determines to be insignificant in both emission rate and ambient air quality impact.

Notwithstanding the above exemptions, any facility which is a major emitting facility pursuant to the definition in Chapter 6, Section 4 shall comply with the requirements of both Chapter 6, Sections 2 and 4.

(l) Approval to construct or modify shall not relieve any owner or operator of the responsibility to comply with all local, state and federal rules and regulations.

(m) After the Administrator has reached a proposed decision based upon the information presented in the permit application to construct or modify, the Division of Air Quality will advertise such proposed decision in a newspaper of general circulation in the county in which the source is proposed. This advertisement will indicate the general nature of the proposed facility, the proposed approval/disapproval of the permit, and a location in the region where the public might inspect the information submitted in support of the requested permit and the Air Quality Division's analysis of the effect on air quality. A copy of the public notice required above will be sent as appropriate to (a) the applicant, (b) the U.S. EPA, (c) any affected comprehensive regional land use planning agency, (d) affected county commissioners, (e) any state or federal land manager or Indian governing body whose lands may be significantly affected by emissions from the proposed facility. The public notice will include notification of the opportunity for a public hearing and will indicate the anticipated degree of increment consumption if the source is subject to Chapter 6, Section 4 of these Regulations. The public will be afforded a 30-day period in which to make comments and recommendations to the Division of Air Quality. A public hearing may be called if sufficient interest is generated or if any aggrieved party so requests in writing within the 30-day comment period. After considering all comments, including those presented at any hearings held, the Administrator will reach a decision and notify the appropriate parties.

(n) (i) Within 30 days of receipt of a permit application for a new major emitting facility or major modification which is subject to the provisions of Chapter 6, Section 4, but not later than 60 days prior to public notice issued under Chapter 6, Section 2(m) above, the Administrator shall provide written notification to all Federal Class I Area Federal Land Managers of such proposed new major emitting facility or major modification whose emissions may affect the Federal Class I Area or affect visibility in such Area. This notification must contain a copy of all information relevant to the permit application including an analysis of the anticipated impacts on air quality and visibility in any Federal Class I Area.

(ii) Within 30 days of receipt of advance notification of a permit application for a new source or facility which may be subject to Chapter 6, Section 4, and which may affect visibility in a Federal Class I Area, the Administrator shall notify the affected Federal Land Manager of such advance notification.

(o) A permit fee will be assessed on the owner or operator (applicant), based on the cost to the Department in reviewing and acting on permit applications submitted to the Division under this section.

(i) Fees for Reviewing the Application: The Department shall provide written notice of the fee to the applicant at such time as the Administrator of the Division reaches a proposed decision on the application under paragraph (m) of this section.

(A) The fee shall include all costs incurred by the Department in reviewing the application to this point in the permit process including the costs of advertising such decision and providing public notice.

(B) The fee is due upon receipt of the written notice unless the fee assessment is appealed pursuant to W.S. 35-11-211(d).

(C) Payment of this fee shall be required before the issuance of any permit under this section.

(ii) Fees for Issuing Permit: An additional fee shall be assessed and written notice provided to the applicant for any additional costs incurred by the Department (after the date of public notice) in reaching a final decision, including the costs of holding public hearings, reviewing public comments, and issuing permits.

(iii) Portable sources or facilities shall be assessed a fee of \$100.00 for operation in each new location. This fee shall be submitted with each “self issuance” permit submitted to the Division for operation under Chapter 6, Section 2(a)(iv) and Chapter 6, Section 2(b) of these regulations. For portable sources or facilities which are not authorized to use the “self issuance” permits, the fee assessment shall be \$250.00 for operation at each new location.

Section 3. **Operating permits.**

(a) Applicability. The following sources are subject to the operating permit requirements of this section:

(i) Any major source;

(ii) Any source, including an area source, subject to a standard, limitation, or other requirement under section 111 of the Act and Chapter 5, Section 2 of the WAQSR;

(iii) Any source, including an area source, subject to a standard or other requirement under section 112 of the Act, except that a source is not required to obtain a permit solely because it is subject to regulations or requirements under section 112(r) of the Act;

(iv) Any “affected source” subject to the acid rain provisions of title IV of the Act;

(v) Any stationary source subject to preconstruction review requirements pursuant to the Prevention of Significant Deterioration of Chapter 6, Section 4 of the WAQSR;

(vi) Any other stationary source in a source category that the EPA may designate by regulation pursuant to the authority granted under the Act.

(vii) The following sources are specifically exempt from operating permit requirements of this section:

(A) Sources subject to Chapter 5, Section 2, Subpart AAA - Standards of Performance for New Residential Wood Heaters; and

(B) Sources subject to the asbestos standards for demolition and renovation of Chapter 3, Section 8.

(viii) Permitted sources which are not subject to the requirements of this section must obtain an operating permit under Chapter 6, Section 2.

(ix) Research and Development Activities. Emissions from research and development facilities which are support facilities collocated with another source under common ownership or control must be included (along with other emissions from the source) in determining the applicability of Chapter 6, Section 3 if fifty (50) percent or more of the output from the research and development facility is used by the main activity at the source. Otherwise, research and development operations may be considered as separate and discrete stationary sources in determining whether such operations are subject to Chapter 6, Section 3 operating permit requirements.

(x) Emissions Units and Chapter 6, Section 3 Sources.

(A) For major sources, the Division shall include in the permit all applicable requirements for all relevant emissions units in the major source.

(B) For any nonmajor source subject to the Chapter 6, Section 3 program under paragraph Chapter 6, Section 3(a), the Division shall include in the permit all applicable requirements applicable to emissions units that cause the source to be subject to the Chapter 6, Section 3 program.

(xi) Fugitive Emissions. Fugitive emissions from a Chapter 6, Section 3 source shall be included in the permit application and the Chapter 6, Section 3 permit in the same manner as stack emissions, regardless of whether the source category in question is included in the list of sources contained in the definition of major source.

(b) Definitions. The following definitions apply to Chapter 6, Section 3. Unless defined differently below, the meaning of the terms used in this section is the same as in Chapter 1, Section 3; Chapter 5, Section 2; Chapter 6, Section 4 of the WAQSR.

(i) “*Act*” means the Clean Air Act, as amended, 42 U.S.C. 7401, et seq.

(ii) “*Affected source*” shall have the meaning given to it in regulations promulgated under Title IV of the Act for the acid rain program.

(iii) “*Affected states*” are all states:

(A) Whose air quality may be affected and that are contiguous to the State of Wyoming where an operating permit, permit modification or permit renewal subject to the provisions of this section is being proposed; or

(B) That are within fifty miles of the permitted source.

(iv) “*Affected unit*” shall have the meaning given to it in the regulations promulgated under Title IV of the Act.

(v) “*Applicable requirement*” means all of the following as they apply to emissions units at a source subject to this section (including requirements with future effective compliance dates that have been promulgated or approved by the EPA or the State through rulemaking at the time of issuance of the operating permit):

(A) Any standard or other requirement provided for in the Wyoming implementation plan approved or promulgated by the EPA under title I of the Act that implements the relevant requirements of the Act, including any revisions to the plan promulgated in 40 CFR part 52;

(B) Any standards or requirements in the WAQSR which are not a part of the approved Wyoming implementation plan and are not federally enforceable;

(C) Any term or condition of any preconstruction permits issued pursuant to regulations approved or promulgated through rulemaking under Title I, including parts C or D of the Act and including Chapter 5, Section 2 and Chapter 6, Sections 2 and 4 of the WAQSR;

(D) Any standard or other requirement promulgated under section 111 of the Act, including section 111(d) and Chapter 5, Section 2 of the WAQSR;

(E) Any standard or other requirement under section 112 of the Act, including any requirement concerning accident prevention under section 112(r)(7) of

the Act and including any regulations promulgated by the EPA and the State pursuant to Section 112 of the Act;

(F) Any standard or other requirement of the acid rain program under Title IV of the Act or the regulations promulgated thereunder;

(G) Any requirements established pursuant to section 504(b) or section 114(a)(3) of the Act concerning enhanced monitoring and compliance certifications;

(H) Any standard or other requirement governing solid waste incineration, under section 129 of the Act;

(I) Any standard or other requirement for consumer and commercial products, under section 183(e) of the Act (having to do with the release of volatile organic compounds under ozone control requirements);

(J) Any standard or other requirement of the regulations promulgated to protect stratospheric ozone under Title VI of the Act, unless the EPA has determined that such requirements need not be contained in a Title V permit;

(K) Any national ambient air quality standard or increment or visibility requirement under part C of Title I of the Act, but only as it would apply to temporary sources permitted pursuant to section 504(e) of the Act; and

(L) Any state ambient air quality standard or increment or visibility requirement of the WAQSR.

(M) Nothing under paragraph (b)(v) of this section shall be construed as affecting the allowance program and Phase II compliance schedule under the acid rain provision of Title IV of the Act.

(vi) “**Commencement of operation**” means the setting into operation of a new or modified source (subject to the provisions of this section) for any purpose.

(vii) “**Department**” means the Wyoming Department of Environmental Quality or its Director.

(viii) “**Designated representative**” or “**alternate designated representative**” shall have the meaning given to it in the regulations promulgated under Title IV of the Act.

(ix) “**Division**” means the Air Quality Division of the Wyoming Department of Environmental Quality or its Administrator.

(x) **“Draft permit”** means the version of a permit for which the Division offers public notice and an opportunity for public comment and hearing.

(xi) **“Emissions allowed under the permit”** means a federally enforceable permit term or condition determined at issuance to be required by an applicable requirement that establishes an emissions limit (including a work practice standard) or a federally enforceable emissions cap that the source has assumed to avoid an applicable requirement to which the source would otherwise be subject.

(xii) **“Emissions unit”** means any part or activity of a stationary source that emits or has the potential to emit any regulated air pollutant or any pollutant listed under section 112(b) of the Act. This term is not meant to alter or affect the definition of the term “unit” for purposes of Title IV of the Act.

(xiii) **“EPA”** means the Administrator of the U.S. Environmental Protection Agency or the Administrator’s designee.

(xiv) **“Final permit”** means the version of an operating permit under this section issued by the Division that has completed all review procedures required by Chapter 6, Section 3(d) and Section 3(e).

(xv) **“Fugitive emissions”** means those emissions which could not reasonably pass through a stack, chimney, vent, or other functionally equivalent opening.

(xvi) **“General permit”** means an operating permit under this section that meets the requirements of Chapter 6, Section 3(i).

(xvii) **“Major source”** means any stationary source (or any group of stationary sources that are located on one or more contiguous or adjacent properties, and are under common control of the same person or persons under common control) belonging to a single major industrial grouping and this is described in paragraphs (A), (B), or (C) of this definition. For the purpose of defining “major source”, a stationary source or group of stationary sources shall be considered part of a single industrial grouping if all of the pollutant emitting activities at such source or group of sources on contiguous or adjacent properties belong to the same Major Group (i.e., all have the same two-digit code) as described in the Standard Industrial Classification Manual, 1987.

(A) A major source under section 112 of the Act, which is defined as:

(I) For pollutants other than radionuclides, any stationary source or group of stationary sources located within a contiguous area and under common control that emits or has the potential to emit, in the aggregate, 10 tons per year (tpy) or more of any hazardous air pollutant which has been listed pursuant to section 112(b) of

the Act, 25 tpy or more of any combination of such hazardous air pollutants, or such lesser quantity as the EPA may establish by rule. Notwithstanding the preceding sentence, emissions from any oil or gas exploration or production well (with its associated equipment) and emissions from any pipeline compressor or pump station shall not be aggregated with emissions from other similar units, whether or not such units are in a contiguous area or under common control, to determine whether such units or stations are major sources; or

(II) For radionuclides, “major source” shall have the meaning specified by the EPA by rule.

(B) A major stationary source of air pollutants, as defined in section 302 of the Act, that directly emits or has the potential to emit, 100 tpy or more of any air pollutant (including any major source of fugitive emissions of any such pollutant, as determined by rule by the EPA). Emissions of air pollutants regulated solely due to section 112(r) of the Act shall not be considered in determining whether a source is a “major source” for purposes of Chapter 6, Section 3 applicability. The fugitive emissions of a stationary source shall not be considered in determining whether it is a major stationary source unless the source belongs to one of the following categories of stationary sources:

(I) Stationary sources listed in Chapter 6, Section 4(a)(i)(a) of the WAQSR; or

(II) Any other stationary source category, which as of August 7, 1980 is being regulated under section 111 or 112 of the Act.

(C) A major stationary source as defined in part D of Title I of the Act (in reference to sources located in non-attainment areas).

(xviii) “**Operating permit**” means any permit or group of permits covering a source under this section that is issued, renewed, amended, or revised pursuant to this section.

(xix) “**Permit modification**” means a revision to an operating permit that meets the requirements of Chapter 6, Section 3(d)(vi).

(xx) “**Permit revision**” means any permit modification or administrative permit amendment.

(xxi) “**Potential to emit**” means the maximum capacity of a stationary source to emit any air pollutant under its physical and operational design. Any physical or operational limitation on the capacity of a source to emit an air pollutant, including air pollution control equipment and restrictions on hours of operation or on the type or

amount of material combusted, stored or processed, shall be treated as part of its design if the limitation is enforceable by the EPA and the Division. This term does not alter or affect the use of this term for any other purposes under the Act, or the term “capacity factor” as used in Title IV of the Act or the regulations promulgated thereunder.

(xxii) “**Proposed permit**” means the version of a permit that the Division proposes to issue and forwards to the EPA for review.

(xxiii) “**Regulated air pollutant**” means the following:

(A) Nitrogen oxides (NO_x) or any volatile organic compound;

(B) Any pollutant for which a national ambient air quality standard has been promulgated;

(C) Any pollutant that is subject to any standard established in Chapter 5, Section 2 of the WAQSR or section 111 of the Act;

(D) Any Class I or II substance subject to a standard promulgated under or established by Title VI of the Act; or

(E) Any pollutant subject to a standard promulgated under section 112 or other requirements established under section 112 of the Act, including sections 112(g), (j), and (r) of the Act, including the following:

(I) Any pollutant subject to requirements under section 112(j) of the Act. If the EPA fails to promulgate a standard by the date established pursuant to section 112(e) of the Act, any pollutant for which a subject source would be major shall be considered to be regulated on the date 18 months after the applicable date established pursuant to section 112(e) of the Act; and

(II) Any pollutant for which the requirements of section 112(g)(2) of the Act have been met, but only with respect to the individual source subject to section 112(g)(2) requirement.

(F) Pollutants regulated solely under section 112(r) of the Act are to be regulated only with respect to the requirements of section 112(r) for permits issued under this section.

(xxiv) “**Regulated pollutant (for fee calculation)**”, which is used only for purposes of Chapter 6, Section 3(f), means any “regulated air pollutant” except the following:

(A) Carbon monoxide;

(B) Any pollutant that is a regulated air pollutant solely because it is a Class I or II substance subject to a standard promulgated under or established by Title VI of the Act; or

(C) Any pollutant that is a regulated air pollutant solely because it is subject to a standard or regulation under section 112(r) of the Act.

(xxv) **“Renewal”** means the process by which a permit is reissued at the end of its term.

(xxvi) **“Responsible official”** means one of the following:

(A) For a Corporation:

(I) A president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision-making functions for the corporation; or

(II) A duly authorized representative of such person if the representative is responsible for the overall operation of one or more manufacturing, production, or operating facilities applying for or subject to a permit and either:

(1.) The facilities employ more than 250 persons or have gross annual sales or expenditures exceeding \$25 million (in second quarter 1980 dollars); or

(2.) The delegation of authority to such representative is approved in advance by the Division;

(B) For a Partnership or Sole Proprietorship: a general partner or the proprietor, respectively;

(C) For a Municipality, State, Federal, or Other Public Agency: Either a principal executive officer or ranking elected official. For the purposes of this part, a principal executive officer of a federal agency includes the chief executive officer having responsibility for the overall operations of a principal geographic unit of the agency; or

(D) For Affected Sources:

(I) The designated representative or alternate designated representative in so far as actions, standards, requirements, or prohibitions under Title IV of the Act or the regulations promulgated thereunder are concerned; and

(II) The designated representative, alternate designated representative, or responsible official under Chapter 6, Section 3(b)(xxvi) for all other purposes under this section.

(xxvii) **“Section 502(b)(10) changes”** are changes that contravene an express permit term. Such changes do not include changes that would violate applicable requirements or contravene federally enforceable permit terms and conditions that are monitoring (including test methods), recordkeeping, reporting or compliance certification requirements.

(xxviii) **“Source”** means any stationary source or area source (if subject to a standard, limitation or other requirement under section 111 or 112 of the Act).

(xxix) **“State”** means any non-Federal permitting authority, including any local agency, interstate association, or statewide program. “State” shall have its conventional meaning where such meaning is clear from the context.

(xxx) **“Stationary source”** means any building, structure, facility, or installation that emits or may emit any regulated air pollutant or any pollutant listed under section 112(b) of the Act.

(xxxi) **“WAQSR”** means the Wyoming Air Quality Standards and Regulations promulgated under the Wyoming Environmental Quality Act, W.S. § 35-11-101 *et seq.*

(c) Permit Applications. Any stationary source or group of stationary sources subject to this section shall submit a timely and complete permit application in accordance with this paragraph.

(i) Timely Application.

(A) A timely application for a source applying for an operating permit under this section for the first time is one that is submitted to the Division within twelve (12) months after the source becomes subject to this section.

(B) Every stationary source or group of stationary sources which are subject to this section under paragraph (a), and which is required to obtain a construction or modification permit under Chapter 5, Section 2 or Chapter 6, Section 2 or 4 of the WAQSR or section 112(g) of the Act shall file a complete application to obtain an operating permit within twelve (12) months after commencing operation. Where an existing operating permit would prohibit such construction or change in operation, the owner or operator must obtain a permit revision before commencing operation.

(C) For the purpose of an operating permit renewal, a timely application is one that is submitted at least six (6) months, but no earlier than eighteen (18) months, prior to the date of the permit expiration.

(D) Transition Period. Initial operating permit applications for sources subject to this section shall be submitted as follows:

(I) Permit applications for operating natural gas compressor engines, operating natural gas sweetening plants, and operating natural gas processing plants subject to the standards of performance of Subpart KKK of Chapter 5, Section 2 of the WAQSR, shall be submitted within four (4) months of the EPA's approval of this operating permit program, but not later than November 15, 1995. This requirement for the early submittal of permit applications includes only major sources as defined in Chapter 6, Section 3(b)(xvi).

(II) Permit applications for all other operating sources subject to this section shall be submitted within twelve (12) months of the EPA's approval of this operating permit program, but not later than November 15, 1995.

(III) Applications for affected facilities addressing State and federal requirements, other than Title IV acid rain program requirements, shall be submitted to the Division within twelve (12) months of EPA approval of the operating permit program, but no later than November 15, 1995. Applications for phase II acid rain permits and all other acid rain permits for affected facilities shall be submitted in accordance with the acid rain permit application deadlines of Chapter 11, Section 2(c)(i)(B).

(IV) All sources listed at Chapter 6, Section 3(a) that are not major sources, affected sources, or solid waste incineration units required to obtain a permit pursuant to section 129(e) of the Act, shall submit a permit application pursuant to this section at such time as the EPA requires such sources to obtain an operating permit in final regulations promulgated pursuant to Title V of the Act.

(ii) Complete Application.

(A) Operating permit applications shall be submitted on the Division's standard operating permit application forms and any required EPA Title IV acid rain permit forms. The information which must be included in the permit application is specified below:

(I) Identifying information, including company name and address (or plant name and address if different from the company name), owner's name and agent, and telephone number and names of plant site manager/contact.

(II) A description of the source's processes and products (by Standard Industrial Classification Code) including any associated with alternate scenarios identified by the source.

(III) The following emissions related information:

(1.) All emissions of pollutants for which the source is major, and all emissions of regulated air pollutants. The permit application shall describe all emissions of regulated air pollutants emitted from any emissions unit. Sufficient information shall be provided to verify which requirements are applicable to the source, and other information necessary to collect any permit fees owed under the fee schedule developed pursuant to Chapter 6, Section 3(f).

The source shall not be required to furnish the above information for insignificant activities and emission levels such as maintenance, cleaning and painting, welding, chemical storage and transfer, and other activities which are incidental to the source's primary business activity and which result in emissions of less than one ton per year of a regulated pollutant not included in the section 112(b) list of hazardous air pollutants or emissions less than 1000 pounds per year of a pollutant regulated pursuant to listing under section 112(b) of the Act. Provided however, such emission levels of hazardous air pollutants do not exceed exemptions based on insignificant emission levels established by EPA through rulemaking for modification under section 112(g) of the Act. The source shall list such insignificant activities, proposed for exclusion, in its application and certify that emissions from each of these activities are less than the above quantities. Activities and emissions which have applicable requirements shall not be excluded from the operating permit application.

(2.) Identification and description of all emission points and fugitive emission sources in sufficient detail to establish the basis for fees and applicability of requirements of the Act and the WAQSR.

(3.) Emission rates in tons per year and in such terms as are necessary to establish compliance consistent with the applicable emission standard and reference test method.

(4.) The following information to the extent it is emissions related: fuels, fuel use, raw materials, production rates, and operating schedules.

(5.) Identification and description of air pollution control equipment and compliance monitoring devices or activities.

(6.) Limitations on source operations affecting emissions or any work practice standards, where applicable, for all regulated pollutants.

(7.) Other information required by any applicable requirements (including information related to stack height limitations pursuant to Chapter 6, Section 2).

(8.) Calculations on which the information in items (1.) through (7.) is based.

(IV) The following air pollution control requirements:

(1.) Citation and description of all applicable requirements; and

(2.) Description of or reference to any applicable test method for determining compliance with each applicable requirement and permit limitation.

(V) Other specific information that may be necessary to implement, and enforce other requirements of the Act and the WAQSR or to determine the applicability of such requirements.

(VI) An explanation of any proposed exemptions from otherwise applicable requirements.

(VII) Additional information as determined to be necessary by the Division to define alternative operating scenarios identified by the source pursuant to Chapter 6, Section 3(h)(i)(I) or to define permit terms and conditions implementing Chapter 6, Section 3(h)(i)(J).

(VIII) A compliance plan that contains the following:

(1.) A description of the compliance status of the source with respect to all applicable requirements.

(2.) A description as follows:

a. For applicable requirements with which the source is in compliance, a statement that the source will continue to comply with such requirements.

b. For applicable requirements that will become effective during the permit term, a statement that the source will meet such requirements on a timely basis.

c. For requirements for which the source is not in compliance at the time of permit issuance, a narrative description of how the source will achieve compliance with such requirements.

(3.) A compliance schedule as follows:

a. For applicable requirements with which the source is in compliance, a statement that the source will continue to comply with such requirements.

b. For applicable requirements that will become effective during the permit term, a statement that the source will meet such requirements on a timely basis. A statement that the source will meet in a timely manner applicable requirements that become effective during the permit term shall satisfy this provision, unless a more detailed schedule is expressly required by the applicable requirement.

c. A schedule of compliance for sources that are not in compliance with all applicable requirements at the time of permit issuance. Such a schedule shall include a schedule of remedial measures, including an enforceable sequence of actions with milestones, leading to compliance with any applicable requirements for which the source will be in noncompliance at the time of permit issuance. This compliance schedule shall resemble and be at least as stringent as that contained in any judicial consent decree or administrative order to which the source is subject. Any such schedule of compliance shall be supplemental to, and shall not sanction noncompliance with, the applicable requirements on which it is based.

(4.) A schedule for submission of certified progress reports where applicable no less frequently than every six months for sources required to have a schedule of compliance to remedy a violation.

(5.) The compliance plan content requirements specified in this paragraph shall apply and be included in the acid rain portion of a compliance plan for an affected source, except as specifically superseded by regulations promulgated under Title IV of the Act with regard to the schedule and method(s) the source will use to achieve compliance with the acid rain emissions limitations.

(IX) Requirements for compliance certification, including the following:

(1.) A certification of compliance with all applicable requirements by a responsible official consistent with Chapter 6, Section 3(c)(iv) and section 114(a)(3) of the Act;

(2.) A statement of methods used for determining compliance, including a description of monitoring, recordkeeping, and reporting requirements and test methods;

(3.) A schedule for submission of compliance certifications during the permit term, to be submitted no less frequently than annually, or more frequently if specified by the underlying applicable requirement or this Division; and

(4.) A statement indicating the source's compliance status with any applicable enhanced monitoring and compliance certification requirements of the Act.

(X) The use of nationally standardized forms for acid rain portions of permit applications and compliance plans, as required by regulations promulgated under Title IV of the Act.

(B) Confidential Information. As provided in sections 35-11-1101(a) and 35-11-205(d) of the Wyoming Environmental Quality Act, upon a satisfactory showing that records, reports or information or particular parts thereof, other than emission and pollution data, if made public would divulge trade secrets, the records, reports or information or particular portions thereof shall be treated as confidential by the Division. The Division may also request under Chapter 6, Section 3(h)(i)(F)(V) that the applicant provide this information directly to the EPA.

(I) An applicant who submits information which it desires to be held confidential may do so by stamping the information as "Confidential" and submitting it in a separate envelope marked "Confidential".

(iii) Duty to Supplement. Any applicant who fails to submit any relevant facts or who has submitted incorrect information in a permit application shall, upon becoming aware of such failure or incorrect submittal, promptly submit such supplementary facts or corrected information. In addition, an applicant shall provide additional information as necessary to address any requirements that become applicable to the source after the date it filed a complete application but prior to release of a draft permit.

(iv) Certification. Any application form, report, or compliance certification submitted pursuant to the WAQSR shall require certification by a responsible official of truth, accuracy, and completeness. This certification and any other certification required under this part shall state that, based on information and belief formed after reasonable inquiry, the statements and information in the document are true, accurate, and complete.

(d) Permit Issuance, Renewal, Reopenings, and Revisions.

(i) Action on Application.

(A) A permit, permit revision, or renewal may be issued only if all of the following conditions have been met:

(I) The Division has received a complete application for a permit, permit modification, or permit renewal, except that a complete application need not be received before issuance of a general permit under Chapter 6, Section 3(i);

(II) Except for modifications qualifying for minor permit modification procedures under Chapter 6, Section 3(d)(vi), the Division has complied with the requirements for public participation specified in this section;

(III) The Division has complied with the requirements for notifying and responding to affected States as required in this section;

(IV) The conditions of the permit provide for compliance with all applicable requirements and requirements of this section; and

(V) The EPA has received a copy of the proposed permit and any notices required under this section, and has not objected to the issuance of the permit within the time period specified in this section.

(B) Except for permits issued during the initial transitional period or under regulations promulgated under Title IV of the Act for permitting affected units under the acid rain program, the Division shall take final action on each permit application, including a request for a permit modification or renewal within 18 months after receiving a complete permit application.

(C) Within 60 days of the receipt of the application, the Division shall provide notice of whether the application is complete. Unless additional information is requested subject to the application or if the applicant is otherwise notified of incompleteness, the application shall be deemed complete after this 60-day period. A completeness determination will not be made for minor permit modifications under Chapter 6, Section 3(d)(vi)(A) and (B).

(D) The Division shall provide a statement that sets forth the legal and factual basis for the draft permit conditions (including references to the applicable statutory or regulatory provisions). The Division will provide this statement to the EPA and any other person who requests it.

(E) The submittal of a complete permit application shall not affect the requirement that any source have a preconstruction permit under Chapter 6, Section 2 or 4 of the WAQSR.

(ii) Requirement for a Permit. Except as provided in this paragraph or in Chapter 6, Section 3(d)(iii), no source requiring an operating permit under Chapter 6, Section 3 may operate after the time that it is required to submit a timely and complete application, except in compliance with a permit issued under this section. If a source submits a timely and complete application for permit issuance (including for renewal), the source's failure to have an operating permit is not a violation of this part until the Division takes final action on the permit application, except as noted in this paragraph. This protection shall cease to apply after a completeness determination made pursuant to Chapter 6, Section 3(d)(i)(C), if the applicant fails to submit by the deadline specified in writing by the Division any additional information identified as being needed to process the application.

(iii) Changes for Which No Permit Revision is Required.

(A) A source may change operations without a permit revision, as allowed under section 502(b)(10) of the Act and W.S. § 35-11-206(f)(iii), provided that:

(I) The change is not a modification under any provision of Title I of the Act and does not violate applicable acid rain requirements under Title IV of the Act;

(II) The change has met the requirements of Chapter 6, Section 2 and is not a modification under Chapter 5, Section 2 or Chapter 6, Section 4 of the WAQSR and the changes do not exceed the emissions allowed under the permit (whether expressed therein as a rate of emissions or in terms of total emissions); and

(III) The source provides the EPA and the Division with written notification at least fourteen (14) days in advance of the proposed change. The source, the EPA, and the Division shall attach such notice to their copy of the relevant permit.

(1.) For each such change, the written notification required shall include a brief description of the change within the permitted source, the date on which the change will occur, any change in emissions, and any permit term or condition that is no longer applicable as a result of the change.

(2.) The permit shield described in Chapter 6, Section 3(k) shall not apply to any change made pursuant to Chapter 6, Section 3(d)(iii).

(iv) Permit Renewal and Expiration.

(A) Permits being renewed are subject to the same procedural requirements, including those for public participation, and affected State and EPA review, that apply to initial permit issuance.

(B) Permit expiration terminates the source's right to operate unless a timely and complete renewal application has been submitted consistent with Chapter 6, Section 3(d)(ii) and Chapter 6, Section 3(c)(i)(C).

(v) Administrative Permit Amendments.

(A) An "administrative permit amendment" is a permit revision that can accomplish one or more of the following changes:

(I) Corrects typographical errors;

(II) Identifies a change in the name, address, or phone number of any person identified in the permit, or provides a similar minor administrative change at the source;

(III) Requires more frequent monitoring or reporting by the permittee;

(IV) Allows for a change in ownership or operational control of a source where the Division determines that no other change in the permit is necessary, provided that a written agreement containing a specific date for transfer of permit responsibility, coverage and liability between the current and new permittees has been submitted to the Division;

(V) Incorporates into the operating permit the requirements from preconstruction review permits issued pursuant to Chapter 6, Sections 2 and 4 of the WAQSR, provided that the process for issuing the preconstruction permit meets procedural requirements substantially equivalent to those that would be applicable under Chapter 6, Section 3(d) and (e) if the change were subject to review as an operating permit modification, and that the permit meets compliance requirements substantially equivalent to those of Chapter 6, Section 3(h); or

(VI) Incorporates any other type of change which the EPA has determined as part of the approved operating permit program to be similar to Chapter 6, Section 3(d)(v)(A)(I) through (V) above.

(B) Administrative permit amendments for purposes of the acid rain portion of the permit shall be governed by regulations promulgated under Title IV of the Act.

(C) An administrative permit amendment may be made by the Division consistent with the following:

(I) The Division shall take final action on a request for an administrative permit amendment within 60 days from the receipt of the request, and may incorporate such changes without providing notice to the public or affected States provided that it designates any such permit revisions as having been made pursuant to this paragraph.

(II) The Division shall submit a copy of the revised permit to the EPA.

(III) The source may implement the changes addressed in the request for an administrative amendment immediately upon submittal of the request.

(D) The Division may, upon taking final action granting a request for an administrative permit amendment, allow coverage by the permit shield in Chapter 6, Section 3(k) for administrative permit amendments made pursuant to Chapter 6, Section 3(d)(v)(A)(V) which meet the relevant requirements of Chapter 6, Section 3(d), 3(h), and 3(e) for significant permit modifications.

(vi) Permit Modification. A permit modification is any revision to an operating permit which can not be accomplished as an administrative permit amendment under Chapter 6, Section 3(d)(v). A permit modification for purposes of the acid rain portion of the permit shall be governed by regulations promulgated under Title IV of the Act.

(A) Minor Permit Modification Procedures.

(I) Criteria.

(1.) Minor permit modification procedures shall be used only for those permit modifications that:

a. Do not violate any applicable requirement;

b. Do not involve significant changes to existing monitoring, reporting, or recordkeeping requirements in the permit;

c. Do not require or change a case-by-case determination of an emission limitation or other standard, or a source-specific determination for temporary sources of ambient impacts, or a visibility or increment analysis;

d. Do not seek to change a permit term or condition for which there is no corresponding underlying applicable requirement and that the source has assumed in order to avoid an otherwise applicable requirement. Such terms and conditions include:

1. A federally enforceable emissions cap assumed to avoid classification as a modification under any provision of Title I of the Act;

2. An alternative emissions limit approved pursuant to regulations promulgated under section 112(i)(5) of the Act concerning early reductions of hazardous air pollutants; and

3. A federally enforceable emissions cap assumed to avoid being subject to provisions of this section pursuant to Chapter 6, Section 3(m) regarding synthetic minors.

e. Are not modifications under any provision of title I of the Act; and

f. Are not required to be processed as a significant modification.

(2.) Notwithstanding Chapter 6, Sections 3(d)(vi)(A) and 3(d)(vi)(B), minor permit modification procedures may be used for permit modifications involving the use of economic incentives, marketable permits, emissions trading, and other similar approaches, to the extent that such minor permit modification procedures are explicitly provided for in the implementation plan.

(3.) Qualifying for a minor permit modification under this section does not relieve a source of its responsibility to obtain a modification permit under the preconstruction permit requirements of Chapter 6, Section 2 of the WAQSR.

(II) Application. An application requesting the use of minor permit modification procedures shall meet the requirements of Chapter 6, Section 3(c)(ii) and shall include the following:

(1.) A description of the change, the emissions resulting from the change, and any new applicable requirements that will apply if the change occurs;

(2.) The source's suggested draft permit;

(3.) Certification by a responsible official, consistent with Chapter 6, Section 3(c)(iv), that the proposed modification meets the criteria for use of minor permit modification procedures and a request that such procedures be used; and

(4.) Completed forms for the Division to use to notify the EPA and affected States as required under Chapter 6, Section 3(e).

(III) EPA and Affected State Notification. Within 5 working days of receipt of a complete permit modification application, the Division shall meet its obligation under Chapter 6, Sections 3(e)(i)(A) and 3(e)(ii)(A) to notify the EPA and affected States of the requested permit modification. The Division shall promptly send any notice required under Chapter 6, Section 3(e)(ii)(B) to the EPA.

(IV) Timetable for Issuance. The Division may not issue a final minor permit modification until after the EPA's 45-day review period or until EPA has notified the Division that EPA will not object to issuance of the permit modification, whichever is first, although the Division can approve the permit modification prior to that time. Within 90 days of the Division's receipt of an application under minor permit modification procedures or 15 days after the end of the EPA's 45-day review period under Chapter 6, Section 3(e)(ii)(D), whichever is later, the Division shall:

(1.) Issue the permit modification as proposed;

(2.) Deny the permit modification application;

(3.) Determine that the requested modification does not meet the minor permit modification criteria and should be reviewed under the significant modification procedures; or

(4.) Revise the draft permit modification and transmit to the EPA the new proposed permit modification as required by Chapter 6, Section 3(e)(i).

(V) Source's Ability to Make Change.

(1.) The Division will allow the source to make the change proposed in its minor permit modification application immediately after it files such application. After the source makes the change allowed by the preceding sentence, and until the Division takes any of the actions specified in Chapter 6, Sections 3(d)(vi)(A)(IV)(1.) through (3.), the source must comply with both the applicable requirements governing the change and the proposed permit terms and conditions. During this time period, the source need not comply with the existing permit terms and conditions it seeks to modify; however, if the source fails to comply with its proposed

permit terms and conditions during this time period, the existing permit terms and conditions it seeks to modify may be enforced against it.

(VI) Permit Shield. The permit shield under Chapter 6, Section 3(k) does not extend to minor permit modifications.

(B) Group Processing of Minor Permit Modifications. The Division may process groups of a source's applications for certain modifications eligible for minor permit modification processing.

(I) Criteria. Group processing of modifications may be used only for those permit modifications:

(1.) That meet the criteria for minor permit modification procedures under Chapter 6, Section 3(d)(vi)(A)(I)(1.); and

(2.) That are collectively below a threshold of 10 percent of the emissions allowed under the permit for the emissions unit for which the change is requested, 20 percent of the applicable definition of major source in Chapter 6, Section 3(b), or 5 tons per year, whichever is least.

(II) Application. An application requesting the use of group processing procedures shall meet the requirements of Chapter 6, Section 3(c)(ii) and shall include the following:

(1.) A description of the change, the emission resulting from the change, and any new applicable requirements that will apply if the change occurs.

(2.) The source's suggested draft permit.

(3.) Certification by a responsible official, consistent with Chapter 6, Section 3(c)(iv) that the proposed modification meets the criteria for use of group processing procedures and a request that such procedures be used.

(4.) A list of the source's other pending applications awaiting group processing, and a determination of whether the requested modification, aggregated with these other applications, equals or exceeds the threshold levels of this part.

(5.) Certification, consistent with Chapter 6, Section 3(c)(iv), that the source has notified EPA of the proposed modification. Such notification need only contain a brief description of the requested modifications.

(6.) Completed forms for the Division to use to notify the EPA and affected States as required under Chapter 6, Section 3(e).

(III) EPA and Affected State Notification. On a quarterly basis or within 5 business days of receipt of an application demonstrating that the aggregate of a source's pending applications equals or exceeds the threshold level of this part, whichever is earlier, the Division shall meet its obligation under Chapter 6, Sections 3(e)(i)(a) and 3(e)(ii)(a) to notify the EPA and affected States of the requested permit modifications. The Division shall send any notice required under Chapter 6, Section 3(e)(ii)(B) to the EPA.

(IV) Timetable for Issuance. The provisions of Chapter 6, Section 3(d)(vi)(A)(IV) shall apply to modifications eligible for group processing, except that the Division shall take one of the actions specified in Chapter 6, Sections 3(d)(vi)(A)(IV)(1.) through (4.) within 180 days of receipt of the application or 15 days after the end of the EPA's 45-day review period, whichever is later.

(V) Source's Ability to Make Change. The provisions of Chapter 6, Section 3(d)(vi)(A)(V) apply to modifications eligible for group processing.

(VI) Permit Shield. The permit shield under Chapter 6, Section 3(k) does not extend to modifications eligible for group processing.

(C) Significant Modification Procedures.

(I) Criteria. Significant modification procedures shall be used for applications requesting permit modifications that do not qualify as minor permit modifications or as administrative amendments. Every significant change in existing monitoring permit terms or conditions and every relaxation of reporting or recordkeeping permit terms or conditions shall require a permit modification under this paragraph. Nothing herein shall be construed to preclude the permittee from making changes consistent with this section that would render existing permit compliance terms and conditions irrelevant.

(II) Significant permit modifications shall meet all requirements of this section including those for applications, public participation, review by affected States, and review by EPA, as they apply to permit issuance and permit renewal. The Division shall complete review on the majority of significant permit modifications within 9 months after receipt of a complete application.

(vii) Reopening for Cause.

(A) Every operating permit issued shall contain provisions specifying the conditions under which the permit will be reopened prior to the expiration

of the permit. A permit shall be reopened and revised under any of the following conditions:

(I) Additional applicable requirements under the Act or the WAQSR become applicable to a major source subject to Chapter 6, Section 3 with a remaining permit term of 3 or more years. Such reopening shall be completed not later than 18 months after promulgation of the applicable requirement. No reopening is required if the effective date of the requirement is later than the date on which the permit is due to expire, unless the original permit or any of its terms and conditions has been extended.

(II) Additional requirements (including excess emissions requirements) become applicable to an affected source under the acid rain program. Upon approval of the EPA, excess emissions offset plans shall be deemed to be incorporated into the permit.

(III) The Division or the EPA determines that the permit contains a material mistake or that inaccurate statements were made in establishing the emissions standards or other terms or conditions of the permit.

(IV) The Division or the EPA determines that the permit must be revised or revoked to assure compliance with applicable requirements.

(B) Proceedings to reopen and issue a permit shall follow the same procedures as apply to initial permit issuance and shall affect only those parts of the permit for which cause to reopen exists. Such reopening shall be made as expeditiously as practicable.

(C) Reopenings under Chapter 6, Section 3(d)(vii)(A) shall not be initiated before a notice of such intent is provided to the source by the Division at least 30 days in advance of the date that the permit is to be reopened, except that the Division may provide a shorter time period in the case of an emergency.

(viii) Reopenings for Cause by the Environmental Protection Agency.

(A) If the EPA finds that cause exists to terminate, modify or revoke and reissue a permit pursuant to Chapter 6, Section 3(d)(vii), the EPA will notify the Division and the permittee of such finding in writing.

(B) The Division shall, within 90 days after receipt of such notification, forward to EPA a proposed determination of termination, modification, or revocation and reissuance, as appropriate. The EPA may extend this 90-day period for an additional 90 days if a new or revised permit application is necessary or if the Division must require the permittee to submit additional information.

(C) The EPA shall review the proposed determination from the Division within 90 days of receipt.

(D) The Division shall have 90 days from receipt of an EPA objection to resolve the objection and to terminate, modify or revoke and reissue the permit in accordance with the EPA's objection.

(E) If the Division fails to submit a proposed determination or fails to resolve any EPA objection, the EPA will terminate, modify, or revoke and reissue the permit after taking the following actions:

(I) Providing at least 30 day's notice to the permittee in writing of the reasons for any such action; and

(II) Providing the permittee an opportunity for comment on the EPA's proposed action and an opportunity for a hearing.

(ix) Public Participation. Except for modification qualifying for minor permit modification procedures, all permit proceedings, including initial permit issuance, significant modifications, and renewals, shall provide procedures for public notice including offering an opportunity for public comment and a hearing on the draft permit. These procedures shall include the following:

(A) Notice shall be given by publication in a newspaper of general circulation in the area where the source is located or in a State publication designed to give general public notice; to persons on a mailing list developed by the Division, including those who request in writing to be on the list; and by other means if necessary to assure adequate notice to the affected public;

(B) The notice shall identify the affected source; the name and address of the permittee; the name and address of the Division; the activity or activities involved in the permit action; the emissions change involved in any permit modification; the name, address, and telephone number of a person from whom interested persons may obtain additional information, including copies of the permit draft, the application, all relevant supporting materials, and all other materials available to the Division that are relevant to the permit decision; a brief description of the comment procedures; and the time and place of any hearing that may be held, including a statement of procedures to request a hearing (unless a hearing has already been scheduled);

(C) The Division shall provide such notice and opportunity for participation by affected States as provided in Chapter 6, Section 3(e);

(D) Timing. The Division shall provide for a 30-day period for public comment and shall give notice of any public hearing at least 30 days in advance of the hearing.

(E) The Division shall keep a record of the commenters and also of the issues raised during the public participation process so that the EPA may fulfill its obligation under section 505(b)(2) of the Act to determine whether a citizen petition may be granted, and such records shall be available to the public.

(e) Permit Review by the Environmental Protection Agency and Affected States.

(i) Information Provided to the Environmental Protection Agency.

(A) The Division shall provide a copy of the permit application (including the compliance plan) directly to the EPA, or the Division may require that the applicant requiring a permit under this section submit a copy of the application directly to the EPA.

(B) The Division shall provide to the Administrator of the EPA a copy of each proposed permit and each final operating permit.

(C) The Division shall keep all records associated with applications and permits under this section for a period of five years.

(ii) Review by Affected States.

(A) The Division shall give notice of each draft permit to any affected State at the time notice is provided to the public under Chapter 6, Section 3(d)(ix), except to the extent Chapter 6, Section 3(d)(vi)(A) allows the time of the notice to be different for minor permit modification procedures.

(B) The Division, as part of the submittal of the proposed permit to the EPA, or for a minor permit modification procedure, as soon thereafter as possible, shall notify the EPA and any affected State in writing of any refusal to accept all recommendations for the proposed permit that the affected State submitted during the public comment period. The notice shall include the Division's reasons for not accepting any such recommendation. The Division is not required to accept recommendations that are not based on applicable requirements or the requirements of this section.

(iii) EPA Objection.

(A) No permit shall be issued if the Administrator of the EPA objects to its issuance in writing within 45 days of receipt of the proposed permit and all necessary supporting information.

(B) Any EPA objection under Chapter 6, Section 3(e)(ii)(C) shall include a statement of reasons for the objection and a description of the terms and conditions that the permit must include to respond to the objections. The EPA shall provide the permit applicant with a copy of the objection.

(C) Failure of the Division to do any of the following shall also constitute grounds for an objection:

(I) Comply with Chapter 6, Sections 3(e)(i)(A) and (B), and Chapter 6, Sections 3(e)(ii)(A) and (B);

(II) Submit any information necessary to adequately review the proposed permit; or

(III) Process the permit under the procedures approved to meet the public participation requirements of Chapter 6, Section 3(d)(ix) except for minor permit modifications.

(D) If the Division fails, within ninety (90) days after the date of an objection under Chapter 6, Section 3(e)(ii)(C), to revise and submit a proposed permit in response to the objection, the EPA will issue or deny the permit in accordance with the requirements of the federal program promulgated under Title V of the Act.

(iv) Public Petitions to the EPA. If the EPA does not object in writing under paragraph (C) of this subsection, any person may petition the EPA within 60 days after the expiration of the 45-day review period to make such an objection. Any such petition shall be based only on objections to the permit that were raised with reasonable specificity during the public comment period provided for in Chapter 6, Section 3(d)(ix), unless the petitioner demonstrates that it was impracticable to raise such objections within such period, or unless the grounds for such objection arose after such period. If the EPA objects to the permit as a result of a petition filed under this paragraph, the Division shall not issue the permit until the EPA's objection has been resolved, except that a petition for review does not stay the effectiveness of a permit or its requirements if the permit was issued after the end of the 45-day review period and prior to the EPA objection. If a permit has been issued, the Division may thereafter issue only a revised permit that satisfies the EPA objection. In any case, the source will not be in violation of the requirement to have submitted a timely and complete application.

(v) No operating permit (including a permit renewal or revision) will be issued until affected States and EPA have had an opportunity to review the proposed permit as required under this section.

(f) Fees.

(i) Fee Requirement. Any source required to obtain a permit under this section shall, as a condition of continued operation, submit an annual fee to the Department.

(ii) Fee Payment. The Department shall give written notice of the amount of fee to be assessed and the basis for such fee assessment to the owner or operator of the source annually. The assessed fee is due on receipt of the notice unless the fee assessment is appealed pursuant to W.S. § 35-11-211(d). If any part of the fee assessment is not appealed it shall be paid to the Department on receipt of the written notice. Any remaining fee which may be due after completion of the appeal is immediately due and payable upon issuance of the council's decision.

(iii) Basis of Fee to Support the Program.

(A) Fees shall be assessed annually for each operating source, based on emissions of each regulated pollutant in an amount sufficient to cover all reasonable direct and indirect costs of the Department in developing, implementing and administering the operating permit program of this section, including the Department's Small Business Assistance Program. The permit fee will cover all reasonable direct and indirect program costs including cost of:

(I) Reviewing and acting on permit applications, permit renewals, permit reopenings, and permit revisions;

(II) Implementing and enforcing the terms and conditions of a permit (not including any court costs or other costs associated with any enforcement action) which include but is not limited to the following:

(1.) Source inspections including the witnessing and review of stack emission tests;

(2.) Ambient monitoring data review and reporting;

(3.) Continuous emission monitoring (CEM) reports and data review;

(4.) Complaint investigations;

(5.) Special purpose monitoring;

(6.) Ambient and CEM systems audits;

(7.) EPA reporting and data entry;

- (III) Emissions and ambient monitoring;
- (IV) Regulation preparation and guidance;
- (V) Modeling analyses and demonstrations;
- (VI) Preparing emission and source inventories and tracking emissions;
- (VII) Fee assessment, billing and fiscal management;
- (VIII) All other permit related functions performed by the Department;
- (IX) Development and administration of Department Small Business Assistance Program; and
- (X) Informational management activities.

(B) Exclusions.

(I) No fee will be assessed for emissions of a regulated pollutant in excess of 4000 tons per year at a source.

(II) For purposes of fee assessment, only under this section, the term “regulated pollutant” shall not include carbon monoxide, asbestos as regulated in Chapter 3, Section 8 of the WAQSR, residential wood smoke as regulated under Chapter 5, Section 2, Subpart AAA, or any substance which would be regulated only because it is listed or regulated under section 112(r) of the Act, prevention of accidental releases for hazardous air pollutants.

(III) Fugitive emissions of total suspended particulate matter (TSP) emissions, provided however, that portion of TSP which is PM₁₀ particulate matter will be estimated and assessed fees.

(iv) Fee Determination.

(A) Fees for individual sources shall be computed by multiplying the total annual emissions, in tons up to a maximum of 4000 tons per year of each regulated pollutant emitted by the source, by the dollar per ton fee calculated as follows:

$$x = F \div T$$

Where: x = dollars per ton of emissions for each regulated pollutant emitted.

F = total annual fee target.

T = total number of tons state-wide of all regulated pollutants listed in the most recent annual emissions inventory for all sources subject to this section.

(B) Annual Fee Target. The annual fee target shall be computed as follows:

$$\text{Annual fee target (F)} = (LA - \text{NSR}) \div 2$$

Where: LA = The amount of funds appropriated from the permit fee fund by the legislature for the operation and implementation of the construction and modification permit programs and the operating permit program for a two-year period. This appropriation includes any carry over in the fund from previous budget periods.

NSR = Projected costs of reviewing and issuing construction and modification permits under the Division's new source review program pursuant to Chapter 6, Sections 2 and 4 of the WAQSR for the two-year budget period.

(C) Individual source fees shall be the greater of fees calculated pursuant to Chapter 6, Section 3(f)(iv)(A) or \$500.00.

(D) A fee of \$250.00 shall be required for the operation of a temporary source at each new location.

(E) Any affected unit which is utilized in an EPA approved Phase I substitution plan under section 404 of the Act during the years of 1995-1999 (inclusive) shall be subject to an annual fee of \$35,000, in lieu of a fee based on actual emissions under Chapter 6, Section 3(d)(v), for each year that it participates in such a substitution plan for the purpose of covering the portion of direct and indirect costs described in Chapter 6, Section 3(d)(iii)(A) attributed to administering the program for those affected units.

(v) Fees Shall Be Based on Actual Emissions.

(A) Actual emissions for purposes of assessing fees are, in order of decreasing accuracy:

(I) Emission measured by a continuous emissions monitoring system (CEMS) that converts pollutant concentrations to mass emission rates and that meets the requirements for CEMS installation, operation, and certification of the WAQSR or any regulation promulgated by EPA under the Act. Actual emissions are the total emissions measured by the CEMS for the year plus estimated emissions during times when the CEMS was not operational.

(II) Emissions measured by periodic stack emission tests which have been accepted by the Division as being representative of normal source operation. Actual emissions are the hourly emission rates multiplied by the annual hours of operation.

(III) Emissions estimated by the utilization of data from the manufacturer of an internal combustion engine or turbine. Actual emissions are the hourly emission rates multiplied by the annual hours of operation.

(IV) Emissions estimated by utilization of the EPA document AP-42, "Compilation of Air Pollutant Emission Factors", or Division approved source-specific emission factors. Actual emissions are the hourly emission rates multiplied by the annual hours of operation.

(B) The methodology selected for the determination of actual emissions for fee assessment by the Division shall be equivalent to methods specified in any Chapter 6, Section 2 permit that the source may hold for initial applications applied for under this section, or emissions as verified by methods prescribed in a permit issued under this section. Actual emissions for sources for which no permit has previously been issued or for which no method has been prescribed in the permit shall be determined by the Division utilizing the most accurate method available as enumerated above under Chapter 6, Section 3(f)(v)(A).

(C) Actual emissions may, at the source's choice, be presumed to be allowable emissions as determined by applicable requirements (standards and regulations) or by permit unless there is evidence that actual emissions are in excess of allowable emissions.

(D) Particulate Emissions: Until such time as continuous measurement of particulate mass emission rates from stacks becomes available or required, particulate mass emission rates for purposes of fee assessment will be based on allowable emission rates.

(E) Fugitive emission rates, for purposes of fee assessment, will be determined by EPA AP-42 emission factors, or by Division approved emission factors, in the case of emissions from surface coal mines and other similar sources of fugitive dust emissions. The use of alternative emission factors which are source specific must be well documented and approved for use by the Division prior to the date on which emission inventories are due to be submitted to the Division.

(F) Emissions in excess of applicable requirements or permit limits due to equipment malfunction and/or failure, or process start-up and shutdowns, to the extent that such emissions are quantifiable through recognized engineering calculations or emissions and process monitoring, shall be included in source emission inventories and assessed a fee.

(G) Fees shall be assessed against owners or operators of sources applying for any permit under this section and annually thereafter for the duration of the permit. Emission inventories for sources subject to this section shall be submitted to the Division for fee assessment and compliance determinations within sixty (60) days following the end of the calendar year.

(I) During the initial year of the operating permit program, sources required to apply for a permit under this section shall be assessed fees which include operations for the calendar year 1994.

(II) Fees shall be based on calendar year source operations.

(III) New sources applying for initial permits under this section shall pay a fee based on emissions occurring since the commencement of operation for the previous calendar year and annually thereafter.

(vi) Failure to Pay Fees. Failure to pay fees owned the Department is a violation of this section and W.S. § 35-11-203 and may be cause for the revocation of any permit issued to the source.

(g) Small Business Assistance Program.

(i) Any source operated or owned by a business which qualifies as a small business under the Department **Small Business Assistance Program** may apply for assistance in complying with the requirements of this section.

(h) Permit Content.

(i) Standard Permit Requirements. Each permit issued under this section shall include the following elements:

(A) Emission limitations and standards, including those operational requirements and limitations that are applied to assure compliance with all applicable requirements at the time of permit issuance.

(I) The permit shall specify and reference the origin of and authority for each term of condition, and identify any difference in form as compared to the applicable requirement upon which the term or condition is based.

(II) The permit shall state that, where an applicable requirement of the Act is more stringent than any applicable requirement of regulations promulgated under Title IV of the Act, both provisions shall be incorporated into the permit and shall be enforceable by the EPA and the Division.

(III) In addition to the requirements in Chapter 6, Section 3(h)(i)(A)(I) and (II), the permit shall include emission limitations and standards which are a part of the WAQSR and are more stringent than those of any requirements of the Act. However, such requirements shall not be federally enforceable.

(B) Permit Duration. The Division shall issue permits for a fixed term of five years for all sources except in such circumstances as provided in W.S. § 35-11-206(f)(i), where a permit may be issued for a shorter term.

(C) Monitoring and Related Recordkeeping and Reporting Requirements.

(I) Each permit shall contain the following requirements with respect to monitoring:

(1.) All emissions monitoring and analysis procedures or test methods required under the applicable monitoring and testing requirements, including any procedures and methods promulgated pursuant to Title IV and sections 504(b) or 114(a)(3) of the Act. If more than one monitoring or testing requirement applies, the permit may specify a streamlined set of monitoring or testing provisions provided the specified monitoring or testing is adequate to assure compliance at least to the same extent as the monitoring or testing applicable requirements that are not included in the permit as the result of such streamlining;

(2.) Where the applicable requirement does not require periodic testing or instrumental or noninstrumental monitoring (which may consist of recordkeeping designed to serve as monitoring), periodic monitoring sufficient to yield reliable data from the relevant time period that are representative of the source's compliance with the permit, as reported pursuant to Chapter 6, Section 3(h)(i)(C)(III). Such monitoring requirements shall assure use of terms, test methods, units, averaging periods, and other statistical conventions consistent with the applicable requirement.

Recordkeeping provisions may be sufficient to meet the requirements of this paragraph; and

(3.) As necessary, requirements concerning the use, maintenance, and, when appropriate, installation of monitoring equipment or methods.

(II) With respect to recordkeeping, the permit shall incorporate all applicable recordkeeping requirements and require, where applicable, the following:

(1.) Records of monitoring information that include the following:

- a. The date, place as defined in the permit, and time of sampling or measurements;
- b. The date(s) the analyses were performed;
- c. The company or entity that performed the analyses;
- d. The analytical techniques or methods used;
- e. The results of such analyses; and
- f. The operating conditions as they existed at the time of sampling or measurement.

(2.) Retention of records of all monitoring data and support information for a period of at least five years from the date of the monitoring sample, measurement, report, or application. Support information includes all calibration and maintenance records and all original strip-chart recordings for continuous monitoring instrumentation, and copies of all reports required by the permit.

(III) With respect to reporting, the permit shall incorporate all applicable reporting requirements and require the following:

(1.) Submittal of Reports of Any Required Monitoring at Least Every Six Months. All instances of deviations from permit requirements must be clearly identified in such reports. All required reports must be certified by a responsible official consistent with Chapter 6, Section 3(c)(iv).

(2.) Prompt reporting of deviations from permit requirements, including those attributable to upset conditions as defined in the permit, the probable cause of such deviations, and any corrective actions or preventive measures taken. The Division shall define “prompt” in relation to the degree and type of deviation likely to occur and the applicable requirements.

(IV) To meet the requirements of Title IV of the Act, for affected sources under the acid rain program, the permit shall incorporate all provisions for monitoring, recordkeeping, and reporting promulgated in 40 CFR part 75.

(D) A permit condition prohibiting emissions exceeding any allowances that the source lawfully holds under Title IV of the Act or the regulations promulgated thereunder.

(I) No permit revision shall be required for increases in emissions that are authorized by allowances acquired pursuant to the acid rain program, provided that such increases do not require a permit revision under any other applicable requirement.

(II) No limit shall be placed on the number of allowances held by the source. The source may not, however, use allowances as a defense for noncompliance with any other applicable requirement.

(III) Any such allowance shall be accounted for according to the procedures established in regulations promulgated under Title IV of the Act.

(E) A severability clause to ensure the continued validity of the various permit requirements in the event of a challenge to any portion(s) of the permit.

(F) Provisions Stating the Following:

(I) Duty to Comply. The permittee must comply with all conditions of the operating permit. Any permit noncompliance constitutes a violation of the Act, Article 2 of the Wyoming Environmental Quality Act and the WAQSR and is grounds for enforcement action; for permit termination, revocation and reissuance, or modification; or for denial of a permit renewal application.

(II) Need to Halt or Reduce Activity is Not a Defense. It shall not be a defense for a permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of the permit.

(III) Permit Actions. The permit may be modified, revoked, reopened, and reissued, or terminated for cause. The filing of a request by the

permittee for a permit modification, revocation and reissuance, or termination, or of a notification of planned changes or anticipated noncompliance does not stay any permit condition.

(IV) Property Rights. The permit does not convey any property rights of any sort, or any exclusive privilege.

(V) Duty to Provide Information. The permittee shall furnish to the Division, within a reasonable time, any information that the Division may request in writing to determine whether cause exists for modifying, revoking and reissuing, or terminating the permit or to determine compliance with the permit. Upon request, the permittee shall also furnish to the Division copies of records required to be kept by the permit, including information claimed and shown to be confidential under Section 35-11-1101(a) of the Wyoming Environmental Quality Act. Upon request by the Division, the permittee shall also furnish confidential information directly to EPA along with a claim of confidentiality.

(G) A provision to ensure that any source under this section pays fees to the Division consistent with Chapter 6, Section 3(f) and the fee schedule developed by the Division and approved by the joint appropriations committee of the Wyoming State Legislature.

(H) Emissions Trading. A provision stating that no permit revision shall be required, under any approved economic incentives, marketable permits, emissions trading and other similar programs or processes for changes that are provided for in the permit.

(I) Terms and conditions for reasonably anticipated operating scenarios identified by the source in its application as approved by the Division. Such terms and conditions:

(I) Shall require the source, contemporaneously with making a change from one operating scenario to another, to record in a log at the permitted source a record of the scenario under which it is operating;

(II) May extend the permit shield described in Chapter 6, Section 3(k) to all terms and conditions under each such operating scenario; and

(III) Must ensure that the terms and conditions of each such alternative scenario meet all applicable requirements and the requirements of this section.

(J) Terms and conditions, if the permit applicant requests them, for the trading of emissions increases and decreases in the permitted source, to the extent that

the applicable requirements, including the State implementation plan, provide for trading such increases and decreases without a case-by-case approval of each emissions trade. Such terms and conditions:

(I) Shall include all terms required under Chapter 6, Section 3(h)(i) and (iii) to determine compliance;

(II) May extend the permit shield described in Chapter 6, Section 3(k) to all terms and conditions that allow such increases and decreases in emissions; and

(III) Must meet all applicable requirements and requirements of this section.

(ii) Federally-Enforceable Requirements.

(A) All terms and conditions in an operating permit under this section, including any provisions designed to limit a source's potential to emit, are enforceable by the EPA and citizens under the Act.

(B) Notwithstanding paragraph (A) above, the Division shall specifically designate as not being federally enforceable under the Act any terms and conditions included in the permit that are not required under the Act or any regulations promulgated thereunder.

(iii) Compliance Requirements. All operating permits under this section shall contain the following elements with respect to compliance:

(A) Consistent with Chapter 6, Section 3(h)(i)(C), compliance certification, testing, monitoring, reporting, and recordkeeping requirements sufficient to assure compliance with the terms and conditions of the permit. Any document (including reports) required by an operating permit under this section shall contain a certification by a responsible official that meets the requirements of Chapter 6, Section 3(c)(iv).

(B) Inspection and entry requirements that require that, upon presentation of credentials and other documents as may be required by law, the permittee shall allow the Division or an authorized representative to perform the following:

(I) Enter upon the permittee's premises where a source is located or emissions related activity is conducted, or where records must be kept under the conditions of the permit.

(II) Have access to and copy, at reasonable times, any records that must be kept under the conditions of the permit.

(III) Inspect at reasonable times any facilities, equipment (including monitoring and air pollution control equipment), practices, or operations regulated or required under the permit.

(IV) As authorized by the Act, sample or monitor, at reasonable times, any substances or parameters for the purpose of assuring compliance with the permit or applicable requirements.

(C) A schedule of compliance consistent with Chapter 6, Section 3(c)(ii)(A)(VIII).

(D) Progress reports consistent with an applicable schedule of compliance and Chapter 6, Section 3(c)(ii)(A)(VIII) to be submitted at least semiannually, or at a more frequent period if specified in the applicable requirement or by the Division. Such progress reports shall contain the following:

(I) Dates for achieving the activities, milestones, or compliance required in the schedule of compliance, and dates when such activities, milestones or compliance were achieved; and

(II) An explanation of why any dates in the schedule of compliance were not or will not be met, and any preventive or corrective measures adopted.

(E) Requirements for compliance certification with terms and conditions contained in the permit, including emission limitations, standards, or work practices. Permits shall include each of the following:

(I) The frequency (not less than annually or such more frequent period as specified in the applicable requirement or by the Division) of submissions of compliance certifications;

(II) A means for assessing or monitoring the compliance of the source with its emissions limitations, standards, and work practices;

(III) A requirement that the compliance certification include the following (provided that the identification of applicable information may cross-reference the permit or previous reports as applicable):

(1.) The identification of each term or condition of the permit that is the basis of the certification;

(2.) The status of compliance with the terms and conditions of the permit for the period covered by the certification, based on the method

or means designated in Chapter 6, Section 3(h)(iii)(E)(III)(4.). The certification shall identify each deviation and take it into account in the compliance certification. The certification shall also identify as possible exceptions to compliance any periods during which compliance is required and in which an excursion or exceedance as defined in Chapter 7, Section 3 occurred;

(3.) Whether compliance was continuous or intermittent;

(4.) The identification of the method(s) or other means used by the owner or operator for determining the compliance status with each term and condition during the certification period, and whether such methods or other means provide continuous or intermittent data. Such methods and other means shall include, at a minimum, the methods and means required under Chapter 6, Section 3(h)(i)(C). If necessary, the owner or operator also shall identify any other material information that must be included in the certification to comply with section 113(c)2 of the Clean Air Act, which prohibits knowingly making a false certification or omitting material information;

(5.) Such other facts as the Division may require to determine the status of the source;

(IV) A requirement that all compliance certifications be submitted to the EPA as well as to the Division.

(F) Such other provisions as the Division may require.

(i) General Permits.

(i) Issuance. The Division may, after notice and opportunity for public comment and hearing pursuant to Chapter 6, Section 3(d)(ix), issue a general permit covering numerous similar sources. Any general permit shall comply with all requirements applicable to other operating permits under this section and shall identify criteria by which sources may qualify for the general permit. To sources that qualify, the Division shall grant the conditions and terms of the general permit. Notwithstanding the shield provisions of Chapter 6, Section 3(k), the source shall be subject to enforcement action for operation without an operating permit under this section if the source is later determined not to qualify for the conditions and terms of the general permit. General permits shall not be authorized for affected sources under the acid rain program unless otherwise provided in regulations promulgated under Title IV of the Act.

(ii) Application. Sources under this section that would qualify for a general permit must apply to the Division for coverage under the terms of the general permit or must apply for an operating permit consistent with Chapter 6, Section 3(c). The

Division may provide for general permit applications which deviate from the requirements of Chapter 6, Section 3(c) provided that such applications meet the requirements of Title V of the Act and include all information necessary to determine qualification for, and to assure compliance with, the general permit. The Division may grant a source's request for authorization to operate under a general permit without repeating the notice and comment procedures required under Chapter 6, Section 3(d)(ix), but such issuance shall not be a final action for purposes of judicial review.

(j) Temporary Sources (Portable Sources). The Division may issue a single permit authorizing emissions from similar operations by the same source owner or operator at multiple temporary locations. The operations must be temporary and involve at least one change of location during the term of the permit. No affected source shall be permitted as a temporary source. Permits for temporary sources shall include the following:

(i) Conditions that will assure compliance with all applicable requirements at all authorized locations;

(ii) Requirements that the owner or operator notify the Division at least ten days in advance of each change in location; and

(iii) Conditions that assure compliance with all other provisions of this section.

(k) Permit Shield.

(i) Except as provided in this part, the Division may expressly include in an operating permit under this section a provision stating that compliance with the conditions of the permit shall be deemed compliance with any applicable requirements as of the date of permit issuance, provided that:

(A) Such applicable requirements are included and are specifically identified in the permit; or

(B) The Division, in acting on the permit application or revision, determines in writing that other requirements specifically identified are not applicable to the source, and the permit includes the determination or a concise summary thereof.

(ii) An operating permit under this section that does not expressly state that a permit shield exists shall be presumed not to provide such a shield.

(iii) Nothing in this paragraph or in any operating permit under this section shall alter or affect the following:

(A) The provisions of section 303 of the Act (emergency orders), including the authority of the EPA under that section.

(B) The liability of an owner or operator of a source for any violation of applicable requirements prior to or at the time of permit issuance.

(C) The applicable requirements of the acid rain program, consistent with section 408(a) of the Act.

(D) The ability of the EPA to obtain information from a source pursuant to section 114 of the Act, or the Division to obtain information pursuant to Section 35-11-110 of the Wyoming Environmental Quality Act.

(l) Emergency Provision.

(i) Definition. An “emergency” means any situation arising from sudden and reasonably unforeseeable events beyond the control of the source, including acts of God, which situation requires immediate corrective action to restore normal operation, and that causes the source to exceed a technology-based emission limitation under the permit, due to unavoidable increases in emissions attributable to the emergency. An emergency shall not include noncompliance to the extent caused by improperly designed equipment, lack of preventative maintenance, careless or improper operation, or operator error.

(ii) Effect of an Emergency. An emergency constitutes an affirmative defense to an action brought for noncompliance with such technology-based emission limitations if the conditions of the following paragraph (l)(iii) are met.

(iii) Affirmative Defense. The affirmative defense of emergency shall be demonstrated through properly signed, contemporaneous operating logs, or other relevant evidence that:

(A) An emergency occurred and that the permittee can identify the cause(s) of the emergency;

(B) The permitted source was at the time being properly operated;

(C) During the period of the emergency the permittee took all reasonable steps to minimize levels of emissions that exceeded the emission standards, or other requirements in the permit; and

(D) The permittee submitted notice of the emergency to the Division within one working day of the time when emission limitations were exceeded due to the emergency. This notice fulfills the requirement of Chapter 6, Section

3(h)(i)(C)(III)(2.). This notice must contain a description of the emergency, any steps taken to mitigate emissions, and corrective actions taken.

(iv) Enforcement. In any enforcement proceeding, the permittee seeking to establish the occurrence of an emergency has the burden of proof.

(v) Scope. This provision is in addition to any emergency or upset provision contained in any applicable requirement.

(m) Permits for Synthetic Minors.

(i) Applicability. A source may apply under this section for a permit or for a condition to a permit to limit emissions below any threshold level which would otherwise subject the source to an applicable requirement or to the provisions of this section utilizing the source's potential to emit. With respect to a condition or permit so issued, the source will not have to comply with the other provisions of this section with the exception of the following:

(A) The payment of a fee based on tons of emissions emitted pursuant to the fee schedule developed under Chapter 6, Section 3(f);

(B) The emissions limit specified in the permit shall be federally enforceable and enforceable by the Division; and

(C) Compliance with any applicable requirements specified in the permit or elsewhere in the WAQSR.

(ii) Use of General Permits. General permits issued in accordance with Chapter 6, Section 3(i) may be utilized by the Division to permit numerous similar synthetic minor sources.

(iii) Use of Chapter 6, Section 2 Permit. A source may apply for a permit under Chapter 6, Section 2 of the WAQSR to qualify as a synthetic minor, provided the permit is federally enforceable.

Section 4. **Prevention of significant deterioration.**

(a) Definitions. For purposes of this section:

“Actual emissions” means the actual rate of emissions of a regulated NSR pollutant from an emissions unit, as determined in accordance with paragraphs (i) through (iii) of this definition, except that this definition shall not apply for calculating whether a significant emissions increase has occurred, or for establishing a PAL under paragraph

(b)(xv) of this section. Instead, the definitions for “Projected actual emissions” and “Baseline actual emissions” of this section shall apply for those purposes.

(i) In general, actual emissions as of a particular date shall equal the average rate, in tons per year, at which the unit actually emitted the pollutant during a consecutive 24-month period which precedes the particular date and which is representative of normal source operation. The Division shall allow the use of a different time period upon a determination that it is more representative of normal source operation. Actual emissions shall be calculated using the unit’s actual operating hours, production rates, and types of materials processed, stored, or combusted during the selected time period.

(ii) The Division may presume that source-specific allowable emissions for the unit are equivalent to the actual emissions of the unit.

(iii) For any emissions unit that has not begun normal operations on the particular date, actual emissions shall equal the potential to emit of the unit on that date.

“Administrator” means Administrator of the Division of Air Quality, Wyoming Department of Environmental Quality.

“Allowable emissions” means the emission rate of a stationary source calculated using the maximum rated capacity of the source (unless the source is subject to enforceable permit conditions which limit the operating rate or hours of operation, or both) and the most stringent of the following:

(i) Applicable standards set forth in Chapter 5, Section 2 or Section 3 of these regulations and other new source performance standards and national emission standards for hazardous air pollutants promulgated by the EPA but not yet adopted by the State of Wyoming.

(ii) Any other applicable emission limit in these regulations.

(iii) The emission rate agreed to by the owner or operator as an enforceable permit condition.

“Baseline actual emissions” means the rate of emissions, in tons per year, of a regulated NSR pollutant, as determined in accordance with paragraphs (i) through (iv) of this definition.

(i) For any existing electric utility steam generating unit, baseline actual emissions means the average rate, in tons per year, at which the unit actually emitted the pollutant during any consecutive 24-month period selected by the owner or operator within the 5-year period immediately preceding when the owner or operator begins actual

construction of the project. The Division shall allow the use of a different time period upon a determination that it is more representative of normal source operation.

(A) The average rate shall include fugitive emissions to the extent quantifiable, and emissions associated with startups, shutdowns, and malfunctions.

(B) The average rate shall be adjusted downward to exclude any non-compliant emissions that occurred while the source was operating above an emission limitation that was legally enforceable during the consecutive 24-month period.

(C) For a regulated NSR pollutant, when a project involves multiple emissions units, only one consecutive 24-month period must be used to determine the baseline actual emissions for the emissions units being changed. A different consecutive 24-month period can be used for each regulated NSR pollutant.

(D) The average rate shall not be based on any consecutive 24-month period for which there is inadequate information for determining annual emissions, in tons per year, and for adjusting this amount if required by paragraph (i)(B) of this definition.

(ii) For an existing emissions unit (other than an electric utility steam generating unit), baseline actual emissions means the average rate, in tons per year, at which the emissions unit actually emitted the pollutant during any consecutive 24-month period selected by the owner or operator within the 10-year period immediately preceding either the date the owner or operator begins actual construction of the project, or the date a complete permit application is received by the Division for a Chapter 6, Section 4 permit, whichever is earlier, except that the 10-year period shall not include any period earlier than November 15, 1990.

(A) The average rate shall include fugitive emissions to the extent quantifiable, and emissions associated with startups, shutdowns, and malfunctions.

(B) The average rate shall be adjusted downward to exclude any non-compliant emissions that occurred while the source was operating above an emission limitation that was legally enforceable during the consecutive 24-month period.

(C) The average rate shall be adjusted downward to exclude any emissions that would have exceeded an emission limitation with which the major stationary source must currently comply, had such major stationary source been required to comply with such limitations during the consecutive 24-month period; however, if an emission limitation is part of a maximum achievable control technology standard that the EPA Administrator proposed or promulgated under 40 CFR 63, the baseline actual emissions need only be adjusted if the Division has taken credit for such emissions

reductions in an attainment demonstration or maintenance plan consistent with the requirements of 40 CFR 51.165(a)(3)(ii)(G).

(D) For a regulated NSR pollutant, when a project involves multiple emissions units, only one consecutive 24-month period must be used to determine the baseline actual emissions for the emissions units being changed. A different consecutive 24-month period can be used for each regulated NSR pollutant.

(E) The average rate shall not be based on any consecutive 24-month period for which there is inadequate information for determining annual emissions, in tons per year, and for adjusting this amount if required by paragraphs (ii)(B) and (C) of this definition.

(iii) For a new emissions unit, the baseline actual emissions for purposes of determining the emissions increase that will result from the initial construction and operation of such unit shall equal zero; and thereafter, for all other purposes, shall equal the unit's potential to emit.

(iv) For a PAL for a stationary source, the baseline actual emissions shall be calculated for existing electric utility steam generating units in accordance with the procedures contained in paragraph (i) of this definition, for other existing emissions units in accordance with the procedures contained in paragraph (ii) of this definition, and for a new emissions unit in accordance with the procedures contained in paragraph (iii) of this definition.

“Baseline area” means any intrastate area (and every part thereof) designated as attainment or unclassifiable under the Federal Clean Air Act in which a major source or major modification establishing the minor source baseline date would construct or would have an air quality impact equal to or greater than $1 \mu\text{g}/\text{m}^3$ (annual average) of the pollutant for which the minor source baseline date is established.

(i) The following baseline areas have been designated as separate particulate matter attainment areas under section 107 of the Clean Air Act:

(A) The Powder River Basin Area, described as that area bounded by Township 40 through 52 North, and Range 69 through 73 West, inclusive of the Sixth Principal Meridian, Campbell and Converse Counties, excluding the areas defined as the Pacific Power and Light attainment area and the Hampshire Energy attainment area.

(B) The Pacific Power and Light Area, described as that area bounded by the NW¹/₄ of Section 27, T50N, R71W, Campbell County, Wyoming.

(C) The Hampshire Energy Area, described as that area bounded by Section 6 excluding the SW¹/₄; E¹/₂ Section 7; Section 17 excluding the SW¹/₄; Section

14 excluding the SE $\frac{1}{4}$; Sections 2, 3, 4, 5, 8, 9, 10, 11, 15, 16 of T48N, R70W and Section 26 excluding the NE $\frac{1}{4}$; SW $\frac{1}{4}$ Section 23; Sections 19, 20, 21, 22, 27, 28, 29, 30, 31, 32, 33, 34, 35 of T49N, R70W, Campbell County, Wyoming.

(D) The Kennecott-Puron Area, described as the area bounded by the W $\frac{1}{2}$ SW $\frac{1}{4}$ Section 18, W $\frac{1}{2}$ NW $\frac{1}{4}$, NW $\frac{1}{4}$ SW $\frac{1}{4}$ Section 19, T47N, R70W, S $\frac{1}{2}$ Section 13, N $\frac{1}{2}$, N $\frac{1}{2}$ SW $\frac{1}{4}$, N $\frac{1}{2}$ SE $\frac{1}{4}$ Section 24 T47N, R71W, Campbell County, Wyoming.

(E) The remainder of the State of Wyoming.

(ii) Any baseline area established originally for the TSP increments shall remain in effect and shall apply for purposes of determining the amount of available PM₁₀ increments.

“Baseline concentration” means that ambient concentration level which exists in the baseline area at the time of the applicable minor source baseline date. A baseline concentration is determined for each pollutant for which a minor source baseline date is established and shall include:

(i) The actual emissions, as defined in this section, representative of sources in existence on the applicable minor source baseline date, except as provided in paragraph (iv) of this definition;

(ii) The allowable emissions of major stationary sources which commenced construction before the major source baseline date, but were not in operation by the applicable minor source baseline date;

(iii) Contributions due to emissions from any emitting source or modification which (1) is not listed in Chapter 6, Section 4(a) under the definition for “Major stationary source”, item (a) and qualified as “major” prior to August 7, 1980 only because fugitive emissions were included in determining potential to emit, (2) submitted a complete permit application under Chapter 6, Section 4(b) or the Federal Clean Air Act prior to August 7, 1980, and (3) was in existence as of the minor source baseline date;

(iv) The following will not be included in the baseline concentration and will affect the applicable maximum allowable increment:

(A) Actual emissions, as defined in this section, from any major stationary source on which construction commenced after the major source baseline date; and

(B) Actual emissions increases and decreases, as determined in accordance with the definition for “Actual emissions” in this section, at any stationary source occurring after the minor source baseline date.

“Begin actual construction” means, in general, initiation of physical on-site construction activities on an emissions unit which are of a permanent nature. Such activities include, but are not limited to, installation of building supports and foundations, laying of underground pipework, and construction of permanent storage structures. With respect to a change in method of operation this term refers to those onsite activities, other than preparatory activities, which mark the initiation of the change.

“Best available control technology” means an emission limitation (including a visible emission standard) based on the maximum degree of reduction of each pollutant subject to regulation under these Standards and Regulations or regulation under the Federal Clean Air Act, which would be emitted from or which results for any proposed major stationary source or major modification which the Administrator, on a case-by-case basis, taking into account energy, environmental, and economic impacts and other costs, determines is achievable for such source or modification through application or production processes and available methods, systems, and techniques, including fuel cleaning or treatment or innovative fuel combustion techniques for control of such pollutant. If the Administrator determines that technological or economic limitations on the application of measurement methodology to a particular emissions unit would make the imposition of an emission standard infeasible, he may instead prescribe a design, equipment, work practice or operational standard or combination thereof to satisfy the requirement of Best Available Control Technology. Such standard shall, to the degree possible, set forth the emission reduction achievable by implementation of such design, equipment, work practice, or operation and shall provide for compliance by means which achieve equivalent results. Application of BACT shall not result in emissions in excess of those allowed under Chapter 5, Section 2 or Section 3 of these regulations and any other new source performance standard or national emission standards for hazardous air pollutants promulgated by the EPA but not yet adopted by the State of Wyoming.

“Clean coal technology” means any technology, including technologies applied at the precombustion, combustion, or post combustion stage, at a new or existing facility which will achieve significant reduction in air emissions of sulfur dioxide or oxides of nitrogen associated with the utilization of coal in the generation of electricity, or process steam which was not in widespread use as of November 15, 1990.

“Clean coal technology demonstration project” means a project using funds appropriated under the heading “Department of Energy-Clean Coal Technology”, up to a total amount of \$2,500,000,000 for commercial demonstration of clean coal technology, or similar projects funded through appropriations for the Environmental Protection Agency. The Federal contribution for a qualifying project shall be at least 20 percent of the total cost of the demonstration project.

“Commenced”, as applied to construction of a major stationary source or major modification, means that the owner or operator has obtained a Construction Permit required by Chapter 6, Section 2 and either has (i) begun, or caused to begin, a continuous

program of actual on-site construction of the source or (ii) entered into binding agreements or contractual obligations, which cannot be canceled or modified without substantial loss to the owner or operator, to undertake a program of construction of the source to be completed within a reasonable time.

“Complete” means, in reference to an application for a permit, that the application contains all the information necessary for processing the application. Designating an application complete for purposes of permit processing does not preclude the Division from requesting or accepting any additional information.

“Construction” means any physical change or change in the method of operation (including fabrication, erection, installation, demolition, or modification of an emissions unit) which would result in a change in emissions.

“Continuous emissions monitoring system (CEMS)” means all of the equipment that may be required to meet the data acquisition and availability requirements of this section, to sample, condition (if applicable), analyze, and provide a record of emissions on a continuous basis.

“Continuous emissions rate monitoring system (CERMS)” means the total equipment required for the determination and recording of the pollutant mass emissions rate (in terms of mass per unit of time).

“Continuous parameter monitoring system (CPMS)” means all of the equipment necessary to meet the data acquisition and availability requirements of this section, to monitor process and control device operational parameters (for example, control device secondary voltages and electric currents) and other information (for example, gas flow rate, O₂ or CO₂ concentrations), and to record average operational parameter value(s) on a continuous basis.

“Electric utility steam generating unit” means any steam electric generating unit that is constructed for the purpose of supplying more than one-third of its potential electric output capacity and more than 25 MW electrical output to any utility power distribution system for sale. Any steam supplied to a steam distribution system for the purpose of providing steam to a steam-electric utility steam generator that would produce electrical energy for sale is also considered in determining the electrical energy output capacity of the affected facility.

“Emissions unit” means any part of a stationary source that emits or would have the potential to emit any regulated NSR pollutant and includes an electric utility steam generating unit as defined in this section. For purposes of this section, there are two types of emissions units as described in paragraphs (i) and (ii) of this definition.

(i) A new emissions unit is any emissions unit that is (or will be) newly constructed and that has existed for less than 2 years from the date such emissions unit first operated.

(ii) An existing emissions unit is any emissions unit that does not meet the requirements in paragraph (i) of this definition.

“Enforceable” means all limitations and conditions which are enforceable under provisions of the Wyoming Environmental Quality Act and/or are federally enforceable by the Administrator of the EPA, including those requirements developed pursuant to 40 CFR parts 60 and 61, requirements within the State Implementation Plan, and any permit requirements established pursuant to 40 CFR 52.21 or under regulations approved pursuant to 40 CFR 51.18 or 51.166.

“Federal Land Manager” means, with respect to any lands in the United States, the Secretary of the Department with authority over such lands.

“Fugitive emissions” means those emissions which could not reasonably pass through a stack, chimney, vent, or other functionally equivalent opening.

“High terrain” means any area having an elevation 900 feet or more above the base of the stack of a source.

“Indian Governing Body” means the governing body of any tribe, band, or group of Indians subject to the jurisdiction of the United States and recognized by the United States as possessing power of self-Government.

“Indian Reservation” means any federally recognized reservation established by treaty, agreement, executive order, or act of Congress.

“Innovative control technology” means any system of air pollution control that has not been adequately demonstrated in practice, but would have a substantial likelihood of achieving greater continuous emissions reduction than any control system in current practice or of achieving at least comparable reductions at lower cost in terms of energy, economics, or non air quality environmental impacts.

“Lowest achievable emission rate (LAER)” means, for any source, the more stringent rate of emissions based on the following:

(i) The most stringent emissions limitation which is contained in the implementation plan of any State for such class or category of stationary source, unless the owner or operator of the proposed stationary source demonstrates that such limitations are not achievable; or

(ii) The most stringent emissions limitation which is achieved in practice by such class or category of stationary sources. This limitation, when applied to a modification, means the lowest achievable emissions rate for the new or modified emissions units within a stationary source. In no event shall the application of the term permit a proposed new or modified stationary source to emit any pollutant in excess of the amount allowable under an applicable new source standard of performance.

“Low terrain” means any area other than high terrain.

“Major modification” means any physical change in or change in the method of operation of a major stationary source that would result in: a significant emissions increase (as defined in the definition for “Significant emissions increase” in this section) of a regulated NSR pollutant (as defined in the definition for “Regulated NSR pollutant” in this section); and a significant net emissions increase of that pollutant from the major stationary source. Any significant emissions increase (as defined in the definition for “Significant emissions increase” in this section) from any emissions units or net emissions increase (as defined in the definition for “Net emissions increase” in this section) at a major stationary source that is significant for volatile organic compounds or NO_x shall be considered significant for ozone.

(i) A physical change or change in the method of operation shall not include:

(A) Routine maintenance, repair and replacement.

(B) Use of an alternative fuel by reason of an order under section 125 of the Federal Clean Air Act;

(C) An increase in the hours of operation or in the production rate, if such increase does not exceed the operating design capacity of the major stationary source unless such change would be prohibited by, or inconsistent with, an enforceable permit issued by the Division;

(D) Use of an alternative fuel or raw material by reason of an order in effect under sections 2(a) and (b) of the Energy Supply and Environmental Coordination Act of 1974 (or any superseding legislation), or by reason of a natural gas curtailment plan in effect pursuant to the Federal Power Act;

(E) Use of an alternative fuel or raw material, if prior to January 6, 1975, the source was capable of accommodating such fuel or material unless such change would be prohibited by, or inconsistent with, an enforceable permit issued by the Division, or if the source is approved to use such fuel or material through an enforceable permit issued under these regulations;

(F) Change in ownership of the stationary source;

(G) The use of municipal solid waste as an alternative fuel at a steam generating plant;

(H) The installation, operation, cessation or removal of a temporary clean coal technology demonstration project, provided that the project complies with:

(I) The Wyoming State Implementation Plan, and

(II) Other requirements necessary to attain and maintain the national ambient air quality standards during the project and after it is terminated.

(I) The installation or operation of a permanent clean coal technology demonstration project that constitutes repowering, provided that the project does not result in an increase in the potential to emit of any regulated pollutant emitted by the unit. This exemption shall apply on a pollutant-by-pollutant basis.

(J) The reactivation of a very clean coal-fired electric utility steam generating unit.

(ii) This definition shall not apply with respect to a particular regulated NSR pollutant when the major stationary source is complying with the requirements under paragraph (b)(xv) of this section for a PAL for that pollutant. Instead, the definition in paragraph (b)(xv)(B) for “PAL major modification” of this section shall apply.

“Major source baseline date” means:

(i) In the case of particulate matter and sulfur dioxide, January 6, 1975;
and

(ii) In the case of nitrogen dioxide, February 8, 1988.

“Major stationary source” means (a) any of the following stationary sources of air pollutants which emit, or have the potential to emit, one hundred tons per year or more of any air pollutant for which standards are established under these Standards and Regulations or under the Federal Clean Air Act: fossil fuel-fired steam electric plants of more than two hundred and fifty million British thermal units per hour heat input, coal cleaning plants (with thermal dryers), kraft pulp mills, Portland Cement plants, primary zinc smelters, iron and steel mill plants, primary aluminum ore reduction plants (with thermal dryers), primary copper smelters, municipal incinerators capable of charging more than two hundred and fifty tons of refuse per day, hydrofluoric, sulfuric, and nitric

acid plants, petroleum refineries, lime plants, phosphate rock processing plants, coke oven batteries, sulfur recovery plants, carbon black plants (furnace process), primary lead smelters, fuel conversion plants, sintering plants, secondary metal production plants, chemical process plants (which does not include ethanol production facilities that produce ethanol by natural fermentation included in NAICS codes 325193 or 312140), fossil fuel boilers (or combinations thereof) of more than two hundred and fifty million British thermal units per hour heat input, petroleum storage and transfer plants with a capacity exceeding three hundred thousand barrels, taconite ore processing plants, glass fiber processing plants, charcoal production plants. (b) Such term also includes any stationary source which emits, or has the potential to emit, two hundred and fifty tons per year or more of any air pollutant for which standards are established under these Standards and Regulations or under the Federal Clean Air Act. (c) Such term also includes any physical change that would occur at a stationary source not otherwise qualifying under this definition if the change would constitute a major stationary source by itself. (d) A major source which is major for volatile organic compounds or NO_x is considered to be major for ozone.

“Minor source baseline date” means the earliest date after August 7, 1977 for particulate matter and sulfur dioxide, and after February 8, 1988 for nitrogen oxides, on which a major stationary source or major modification submits a complete permit application under Chapter 6, Section 4(b) or under the Federal Clean Air Act.

(i) The minor source baseline date for sulfur dioxide for the State of Wyoming is February 2, 1978.

(ii) The minor source baseline date for nitrogen oxides for the State of Wyoming is February 26, 1988.

(iii) The minor source baseline date for particulate matter is as follows:

(A) For the Powder River Basin Area – March 6, 1997;

(B) For the Pacific Power and Light Area – June 18 1980;

(C) For the Hampshire Energy Area – September 30, 1982;

(D) For the Kennecott-Puron Area – February 27, 1995;

(E) For the rest of the State of Wyoming – February 22, 1979.

(iv) The baseline date is established for each pollutant for which increments or other equivalent measures have been established, if:

(A) The area in which the proposed source or modification would construct is designated as attainment or unclassifiable under the Federal Clean Air Act for the pollutant on the date of its complete application; and

(B) In the case of a major stationary source, the pollutant would be emitted in significant amounts, or in the case of a major modification, there would be a significant net emissions increase of the pollutant.

(v) The baseline date is not established by the permit application for an emitting source or modification which (1) is not listed in Chapter 6, Section 4(a) under the definition for “Major stationary source”, item (a), (2) qualified as “major” prior to August 7, 1980 only because fugitive emissions were included in determining potential to emit, and (3) submitted a complete permit application under Chapter 6, Section 4(b) or the Federal Clean Air Act prior to August 7, 1980.

(vi) Any minor source baseline date established originally for the TSP increments shall remain in effect and shall apply for purposes of determining the amount of available PM₁₀ increments.

“Net emissions increase” means, with respect to any regulated NSR pollutant emitted by a major stationary source, the amount by which the sum of the following exceeds zero:

(i) The increase in emissions from a particular physical change or change in the method of operation at a stationary source as calculated pursuant to paragraph (b)(i)(J) of this section;

(ii) Any other increases and decreases in actual emissions at the major stationary source that are contemporaneous with the particular change and are otherwise creditable. Baseline actual emissions for calculating increases and decreases under this paragraph (ii) shall be determined as provided in the definition for “Baseline actual emissions”, except that paragraphs (i)(C) and (ii)(D) of the definition for “Baseline actual emissions” shall not apply.

(iii) An increase or decrease in actual emissions is contemporaneous with the increase from the particular change only if it occurs between:

(A) The date five years before construction on the particular change commences; and

(B) The date that the increase from the particular change occurs.

(iv) An increase or decrease in actual emissions is creditable only if:

(A) The Division has not relied on it in issuing a Chapter 6, Section 4 permit for the source, which is in effect when the increase in actual emissions from the particular change occurs.

(v) An increase or decrease in actual emissions of sulfur dioxide, particulate matter, or nitrogen oxides that occurs before the applicable minor source baseline date is creditable only if it is required to be considered in calculating the amount of maximum allowable increases remaining available.

(vi) An increase in actual emissions is creditable only to the extent that the new level of actual emissions exceeds the old level.

(vii) A decrease in actual emissions is creditable only to the extent that:

(A) The old level of actual emissions or the old level of allowable emissions, whichever is lower, exceeds the new level of actual emissions;

(B) It is enforceable as a practical matter at and after the time that actual construction on the particular change begins;

(C) It has approximately the same qualitative significance for public health and welfare as that attributed to the increase from the particular change; and

(viii) An increase that results from a physical change at a source occurs when the emissions unit on which construction occurred becomes operational and begins to emit a particular pollutant. Any replacement unit that requires shakedown becomes operational only after a reasonable shakedown period, not to exceed 180 days.

(ix) The definition of “Actual emissions” of this section, shall not apply for determining creditable increases and decreases.

“Potential to emit” means the maximum capacity of a stationary source to emit a pollutant under its physical and operational design. Any physical or operational limitation on the capacity of the source to emit a pollutant, including air pollution control equipment and restrictions on hours of operation or the type or amount of material combusted, stored, or processed, shall be treated as part of its design if the limitation or the affect it would have on emissions is enforceable. Secondary emissions do not count in determining the potential to emit of a stationary source.

“Predictive emissions monitoring system (PEMS)” means all of the equipment necessary to monitor process and control device operational parameters (for example, control device secondary voltages and electric currents) and other information (for example, gas flow rate, O₂ or CO₂ concentrations), and calculate and record the mass emissions rate (for example, lb/hr) on a continuous basis.

“Project” means a physical change in, or change in method of operation of, an existing major stationary source.

“Projected actual emissions” means the maximum annual rate, in tons per year, at which an existing emissions unit is projected to emit a regulated NSR pollutant in any one of the 5 years (12-month period) following the date the unit resumes regular operation after the project, or in any one of the 10 years following that date, if the project involves increasing the emissions unit’s design capacity or its potential to emit that regulated NSR pollutant, and full utilization of the unit would result in a significant emissions increase, or a significant net emissions increase at the major stationary source.

(i) In determining the projected actual emissions under the above paragraph of this section (before beginning actual construction), the owner or operator of the major stationary source:

(A) Shall consider all relevant information, including but not limited to, historical operational data, the company’s own representations, the company’s expected business activity and the company’s highest projections of business activity, the company’s filings with the State or Federal regulatory authorities, and compliance plans approved by the Division;

(B) Shall include fugitive emissions to the extent quantifiable and emissions associated with startups, shutdowns, and malfunctions;

(C) Shall exclude, in calculating any increase in emissions that results from the particular project, that portion of the unit’s emissions following the project that an existing unit could have accommodated during the consecutive 24-month period used to establish the baseline actual emissions under the definition for “Baseline actual emissions” of this section and that are also unrelated to the particular project, including any increased utilization due to product demand growth; or,

(D) In lieu of using the method set out in paragraphs (i)(A) through (C) of this definition, may elect to use the emissions unit’s potential to emit, in tons per year, as defined under the definition of “Potential to emit” of this section.

“Reactivation of a very clean coal-fired electric utility steam generating unit” means any physical change or change in the method of operation associated with the commencement of commercial operations by a coal-fired utility unit after a period of discontinued operation where the unit:

(i) Has not been in operation for the two-year period prior to the enactment of the Clean Air Act Amendments of 1990, and the emissions from such unit continue to be carried in the State of Wyoming’s emissions inventory at the time of enactment;

(ii) Was equipped prior to shut-down with a continuous system of emissions control that achieves a removal efficiency for sulfur dioxide of no less than 85 percent and a removal efficiency for particulates of not less than 98 percent;

(iii) Is equipped with low-NO_x burners prior to the time of commencement of operations following reactivation; and

(iv) Is otherwise in compliance with the requirements of the Clean Air Act.

“Regulated NSR pollutant”, for purposes of this section, means the following:

(i) Any pollutant for which a national ambient air quality standard has been promulgated and any pollutant identified under this paragraph as a constituent or precursor to such pollutant. Precursors identified by the EPA Administrator for purposes of NSR are the following:

(A) Volatile organic compounds and nitrogen oxides are precursors to ozone in all attainment and unclassifiable areas.

(B) Sulfur dioxide is a precursor to PM_{2.5} in all attainment and unclassifiable areas.

(C) Nitrogen oxides are presumed to be precursors to PM_{2.5} in all attainment and unclassifiable areas, unless the State demonstrates to the EPA Administrator’s satisfaction or EPA demonstrates that emissions of nitrogen oxides from sources in a specific area are not a significant contributor to that area’s ambient PM_{2.5} concentrations.

(D) Volatile organic compounds are presumed not to be precursors to PM_{2.5} in any attainment or unclassifiable area, unless the State demonstrates to the EPA Administrator’s satisfaction or EPA demonstrates that emissions of volatile organic compounds from sources in a specific area are a significant contributor to that area’s ambient PM_{2.5} concentrations.

(ii) Any pollutant that is subject to any standard promulgated under section 111 of the Federal Clean Air Act;

(iii) Any Class I or II substance subject to a standard promulgated under or established by Title VI of the Federal Clean Air Act;

(iv) Any pollutant that otherwise is subject to regulation under the Federal Clean Air Act; except that any or all hazardous air pollutants either listed in section 112 of the Federal Clean Air Act or added to the list pursuant to section 112(b)(2) of the

Federal Clean Air Act, which have not been delisted pursuant to section 112(b)(3) of the Federal Clean Air Act, are not regulated NSR pollutants unless the listed hazardous air pollutant is also regulated as a constituent or precursor of a general pollutant listed under section 108 of the Federal Clean Air Act.

(v) [Reserved.]

(vi) Particulate matter (PM) emissions, PM_{2.5} emissions, and PM₁₀ emissions shall include gaseous emissions from a source or activity which condense to form particulate matter at ambient temperatures. On or after January 1, 2011, such condensable particulate matter shall be accounted for in applicability determinations and in establishing emissions limitations for PM, PM_{2.5} and PM₁₀ in PSD permits. Compliance with emissions limitations for PM, PM_{2.5} and PM₁₀ issued prior to this date shall not be based on condensable particulate matter unless required by the terms and conditions of the permit or the applicable implementation plan. Applicability determinations made prior to this date without accounting for condensable particulate matter shall not be considered in violation of this section unless the applicable implementation plan required condensable particulate matter to be included.

“Replacement unit” means an emissions unit for which all the criteria listed in this section are met. No creditable emission reductions shall be generated from shutting down the existing emissions unit that is replaced.

(i) The emissions unit is a reconstructed unit within the meaning of 40 CFR part 60.15(b)(1), or the emissions unit completely takes the place of an existing emissions unit.

(ii) The emissions unit is identical to or functionally equivalent to the replaced emissions unit.

(iii) The replacement does not change the basic design parameter(s) (as discussed in 40 CFR part 51.166(y)(2)) of the process unit.

(iv) The replaced emissions unit is permanently removed from the major stationary source, otherwise permanently disabled, or permanently barred from operation by a permit that is enforceable as a practical matter. If the replaced emissions unit is brought back into operation, it shall constitute a new emissions unit.

“Repowering” means replacement of an existing coal-fired boiler with one of the following clean coal technologies: atmospheric or pressurized fluidized bed combustion, integrated gasification combined cycle, magnetohydrodynamics, direct and indirect coal-fired turbines, integrated gasification fuel cells, or as determined by the Administrator of EPA, in consultation with the Secretary of Energy, a derivative of one or more of these technologies, and any other technology capable of controlling multiple combustion

emissions simultaneously with improved boiler or generation efficiency and with significantly greater waste reduction relative to the performance of technology in widespread commercial use as of November 15, 1990.

(i) Repowering shall also include any oil and/or gas-fired unit which has been awarded clean coal technology demonstration funding as of January 1, 1991, by the Department of Energy.

(ii) The Administrator shall give expedited consideration to permit applications for any source that satisfies the requirements of this subsection and is granted an extension under section 409 of the Clean Air Act.

“Secondary emissions” means emissions which occur as a result of the construction or operation of a major stationary source or major modification, but do not come from the major stationary source or major modification itself. For the purposes of this section, secondary emissions must be specific, well defined, quantifiable, and impact the same general areas as the stationary source or modification which causes the secondary emissions. Secondary emissions include emissions from any offsite support facility which would not be constructed or increase its emissions except as a result of the construction or modification of the major stationary source or major modification. Secondary emissions do not include any emissions which come directly from a mobile source, such as emissions from the tailpipe of a motor vehicle or from a train.

“Significant” means:

(i) In reference to a net emissions increase or the potential of a source to emit any of the following pollutants, a rate of emissions that would equal or exceed any of the following rates:

POLLUTANT AND EMISSIONS RATE

Carbon monoxide:	100 tons per year (tpy)
Nitrogen oxides:	40 tpy
Sulfur dioxide:	40 tpy
Particulate matter:	25 tpy of particulate matter emissions; 15 tpy of PM ₁₀ emissions
PM _{2.5} :	10 tpy of direct PM _{2.5} emissions; 40 tpy of sulfur dioxide emissions; 40 tpy of nitrogen oxide emissions unless demonstrated not to be a PM _{2.5} precursor under the definition of “Regulated NSR pollutant” in Section 4(a) of this chapter

Ozone:	40 tpy of volatile organic compounds or nitrogen oxides
Lead:	0.6 tpy
Fluorides:	3 tpy
Sulfuric acid mist:	7 tpy
Hydrogen sulfide (H ₂ S):	10 tpy
Total reduced sulfur (including H ₂ S):	10 tpy
Reduced sulfur compounds (including H ₂ S):	10 tpy
Municipal waste combustor organics (measured as total tetra- through octa-chlorinated dibenzo-p-dioxins and dibenzofurans):	3.2 x 10 ⁻⁶ megagrams per year (3.5 x 10 ⁻⁶ tons per year)
Municipal waste combustor metals (measured as particulate matter):	14 megagrams per year (15 tons per year)
Municipal waste combustor acid gases (measured as sulfur dioxide and hydrogen chloride):	36 megagrams per year (40 tons per year)
Municipal solid waste landfill emissions (measured as nonmethane organic compounds):	45 megagrams per year (50 tons per year)

(ii) “Significant” means, in reference to a net emissions increase or the potential of a source to emit a pollutant subject to these regulations and regulations under the Clean Air Act, that paragraph (i) above does not list, any emissions rate.

(iii) Notwithstanding paragraph (i) above, “significant” means any emissions rate or any net emissions increase associated with a major stationary source or major modification which would construct within 10 kilometers of a Class I Area, and have an impact on such area equal to or greater than 1 µg/m³ (24-hour average).

“**Significant emissions increase**” means, for a regulated NSR pollutant, an increase in emissions that is significant (as defined in paragraph (i) of the definition of “Significant” in this section) for that pollutant.

“**Stationary source**” means any structure, building, facility, equipment, installation or operation (or combination thereof) which emits or may emit any air pollutant subject to these regulations or regulations under the Federal Clean Air Act.

“**Structure, building, facility, equipment, installation, or operation**” means all of the pollutant-emitting activities which belong to the same industrial grouping, are located on one or more contiguous or adjacent properties, and are under the control of the same person (or persons under common control) except the activities of any vessel. Pollutant-

emitting activities shall be considered as part of the same industrial grouping if they belong to the same *Major Group* (i.e., which have the same two-digit code) as described in the *Standard Industrial Classification Manual, 1972*, as amended by the 1977 Supplement (U.S. Government Printing Office stock numbers 4101-0066 and 003-005-00176-0, respectively).

“Temporary clean coal technology demonstration project” means a clean coal technology demonstration project that is operated for a period of 5 years or less, and which complies with the Wyoming State Implementation Plan and other requirements necessary to attain and maintain the national ambient air quality standards during the project and after it is terminated.

“Volatile organic compounds (VOCs)” is defined in Chapter 3, Section 6(a) of these regulations.

(b) Any person who plans to construct any major stationary source or undertake a major modification of an existing stationary source shall be subject to the conditions outlined below.

(i) (A) (I) The review of the stationary source for the construction or modification permit(s) required under Chapter 6, Section 2 of these regulations shall apply and shall be expanded so as to include analysis of the predicted impact of the allowable and secondary emissions from the stationary source on the ambient air quality in areas affected by such emissions. An analysis of the predicted impact of emissions from the stationary source is required for all pollutants for which standards have been established under these regulations or under the Federal Clean Air Act and which are emitted in significant amounts. An analysis of the impact of other pollutants may be required by the Administrator. Such analysis shall identify and quantify the impact on the air quality in the area of all emissions not included in the baseline concentrations including, but not limited to, those emissions resulting from the instant application and all other permits issued in the area. The purpose of this analysis is to determine the total deterioration of air quality from the baseline concentrations; however, projections of deterioration due to general non-stationary source growth in the area predicted to occur after the date of application is not required. A permit to construct pursuant to Chapter 6, Section 2 shall be issued only if the conditions of Chapter 6, Section 2 are complied with and if the predicted impact (over and above the baseline concentration) of emissions defined above is less than the maximum allowable increment shown in Table 1 for the classification of the area in which the impact is predicted and if the ambient standard for the pollutant(s) is not exceeded.

Table 1
Maximum Allowable Increments of Deterioration - $\mu\text{g}/\text{m}^3$

Pollutant	Class I	Class II
Particulate Matter:		
PM ₁₀ , annual arithmetic mean	4	17
PM ₁₀ , 24-hour maximum	8	30
Sulfur Dioxide:		
Annual arithmetic mean	2	20
24-hour maximum*	5	91
3-hour maximum*	25	512
Nitrogen Dioxide		
Annual arithmetic mean	2.5	25

*Maximum allowable increment may be exceeded once per year at any receptor site.

(II) Notwithstanding the provisions of paragraph (b)(i)(A)(I) above, the following concentrations shall be excluded in determining compliance with maximum allowable increases:

(1.) Concentrations attributable to the increase in emissions from stationary sources which have converted from the use of petroleum products, natural gas, or both by reason of an order in effect under sections 2(a) and (b) of the Energy Supply and Environmental Coordination Act of 1974 (or any superseding legislation) over the emissions from such sources before the effective date of such an order. No such exclusion shall apply for more than five years after the later of such effective dates;

(2.) Concentrations attributable to the increase in emissions from sources which have converted from using natural gas by reason of natural gas curtailment plan in effect pursuant to the Federal Power Act over the emissions from such sources before the effective date of such plan. No such exclusion shall apply for more than 5 years after the later of such effective date;

(3.) Concentrations of particulate matter attributable to the increase in emissions from construction or other temporary emission-related activities of new or modified sources;

(4.) The increase in concentrations attributable to new sources outside the United States over the concentrations attributable to existing sources which are included in the baseline concentrations; and

(5.) Concentrations attributable to the temporary increase in emissions of sulfur dioxide, particulate matter, or nitrogen oxides from stationary sources as specified below.

a. The temporary emissions do not occur for more than 2 years.

b. The 2-year time period is not renewable.

c. Such temporary emissions are not eligible for exclusion if they would impact a Class I Area or an area where the applicable increment is known to be violated or an area where they would cause or contribute to a violation of the applicable ambient air quality standard.

d. At the end of the temporary emission time frame, emissions from the stationary source causing these temporary emissions shall not exceed those levels occurring at such source prior to such temporary emission.

(B) In addition to the analyses required under Chapter 6, Section 4(b)(i)(A) above,

(I) The owner or operator shall provide an analysis of the impairment to visibility, soils and vegetation that would occur as a result of the source or modification and general commercial, residential, industrial, and other growth associated with the source or modification. The owner or operator need not provide an analysis of the impact on vegetation having no significant commercial or recreational value.

(II) The owner or operator shall provide an analysis of the air quality impact projected for the area as a result of general commercial, residential, industrial and other growth associated with the source or modification.

(C) The requirements for demonstration of compliance with applicable increments of Chapter 6, Section 4(b)(i)(A)(I), the additional analysis requirements of Chapter 6, Section 4(b)(i)(B) and the ambient air quality analysis requirements of Chapter 6, Section 4(b)(i)(E) shall not apply to a proposed major stationary source or modification with respect to a particular pollutant if the Administrator determines that:

(I) The increase in allowable emissions of that pollutant from the stationary source or the net emissions increase of that pollutant from a modification would be temporary and would impact no Class I Area and no area where an applicable increment is known to be violated; or

(II) The stationary source was in existence on March 1, 1978, and that the maximum allowable emission increases only impact Class II Areas, and that after application of BACT, the increase in allowable emissions of each pollutant would be less than 50 tons per year.

(D) Fugitive emissions, to the extent quantifiable, will be considered in calculating the potential to emit of the stationary source or modification only for:

(I) Sources listed in Chapter 6, Section 4(a) under the definition of "Major stationary source", item (a).

(II) Any other stationary source category which, as of August 7, 1980, is being regulated under section 111 or 112 of the Clean Air Act.

(III) And such other sources as the Environmental Quality Council may later determine.

(E) An application subject to this section shall contain an analysis of ambient air quality in the area that would be affected by the stationary source or modification as required below:

(I) For each pollutant that the source would have the potential to emit in a significant amount.

(II) For the modification, each pollutant for which it would result in a significant net emissions increase.

(III) For pollutants for which National Ambient Air Quality Standards have been established, the analysis shall contain continuous air quality monitoring data gathered for purposes of determining whether emissions of that pollutant would cause or contribute to a violation of the standard or any maximum allowable increase.

(IV) In general, the required continuous air quality monitoring data shall have been gathered over a period of one year immediately preceding receipt of the application. The Administrator may provide that the monitoring period specification may be reduced to a minimum of four months if he is satisfied that a complete and adequate analysis can be accomplished with monitoring data gathered over a period shorter than one year.

(V) All monitoring conducted pursuant to the requirements of this section shall meet the requirements of Appendix B of 40 CFR part 58.

(VI) The requirements for pre-construction monitoring specified above and under Chapter 6, Section 2(b) with respect to monitoring for a particular pollutant may be waived by the Administrator upon petition from an applicant if:

(1.) The emissions increase of the pollutant from a new stationary source or the net emissions increase of the pollutant from a modification would cause, in any area, air quality impacts less than the following amounts:

- a. Carbon Monoxide - $575 \mu\text{g}/\text{m}^3$, 8-hour average;
- b. Nitrogen Dioxide - $14 \mu\text{g}/\text{m}^3$, annual average;
- c. Particulate Matter - $10 \mu\text{g}/\text{m}^3$ of PM_{10} , 24-hour average;
- d. Sulfur Dioxide - $13 \mu\text{g}/\text{m}^3$, 24-hour average;
- e. Ozone (No *de minimis* air quality level is provided for ozone; however, any net emissions increase of 100 tons per year or more of volatile organic compounds or nitrogen oxides subject to PSD would be required to perform an ambient impact analysis, including the gathering of air quality data.)
- f. Lead - $0.1 \mu\text{g}/\text{m}^3$, 3-month average;
- g. Fluorides - $0.25 \mu\text{g}/\text{m}^3$, 24-hour average;
- h. Total Reduced Sulfur - $10 \mu\text{g}/\text{m}^3$, 1-hour average;
- i. Hydrogen Sulfide - $0.2 \mu\text{g}/\text{m}^3$, 1-hour average;
- j. Reduced Sulfur Compounds - $10 \mu\text{g}/\text{m}^3$, 1-hour average; or

(2.) The concentrations of the pollutant in the area that the source or modification would affect are less than the concentrations listed in paragraph (b)(i)(E)(VI)(1.) of this section; or

(3.) The pollutant is not listed in paragraph (b)(i)(E)(VI)(1.) of this section.

(F) The Administrator may require an applicant subject to the provisions of this section to conduct an approved visibility monitoring program in any Class I Area which may be impacted by emissions from the proposed stationary source.

(G) At such time that a particular source or modification becomes a major stationary source or major modification solely by virtue of a relaxation in any enforceable limitation which was established after August 7, 1980 on the capacity of the source or modification otherwise to emit a pollutant, then all of the provisions of Chapter 6, Sections 2 and 4 shall apply to the source or modification as though construction had not yet commenced on the source or modification.

(H) The following specific provisions apply to projects at existing emissions units at a major stationary source (other than projects at a source with a PAL) in circumstances where the owner or operator elects to use the method specified in paragraphs (i)(A) through (C) of the definition for "Projected actual emissions" for calculating projected actual emissions.

(I) Before beginning actual construction of the project, the owner or operator shall document and maintain a record of the following information:

(1.) A description of the project;

(2.) Identification of the emissions unit(s) whose emissions of a regulated NSR pollutant could be affected by the project; and

(3.) A description of the applicability test used to determine that the project is not a major modification for any regulated NSR pollutant, including the baseline actual emissions, the projected actual emissions, the amount of emissions excluded under paragraph (i)(C) of the definition for "Projected actual emissions" in Section 4(a) and an explanation for why such amount was excluded, and any netting calculations, if applicable.

(II) Before beginning actual construction, the owner or operator shall provide the information set out in paragraph (b)(i)(H)(I) of this section to the Division as a Chapter 6, Section 2 permit application.

(III) The owner or operator shall monitor the emissions of any regulated NSR pollutant that could increase as a result of the project and that is emitted by any emissions unit identified in paragraph (b)(i)(H)(I)(2.) of this section; and calculate and maintain a record of the annual emissions, in tons per year on a calendar year basis, for a period of 5 years following resumption of regular operations after the

change, or for a period of 10 years following resumption of regular operations after the change if the project increases the design capacity or potential to emit of that regulated NSR pollutant at such emissions unit.

(IV) The owner or operator shall submit a report to the Division within 60 days after the end of each year during which records must be generated under paragraph (b)(i)(H)(III) of this section setting out the unit's annual emissions during the calendar year that preceded submission of the report.

(I) The owner or operator of the source shall make the information required to be documented and maintained pursuant to paragraph (b)(i)(H) of this section available for review upon request for inspection by the Division or the general public pursuant to the requirements contained in 40 CFR 70.4(b)(3)(viii).

(J) (I) Except as otherwise provided in paragraph (b)(xv) of this section, and consistent with the definition of "Major modification" contained in Section 4(a), a project is a major modification for a regulated NSR pollutant if it causes two types of emissions increases—a significant emissions increase (as defined in the definition for "Significant emissions increase" in Section 4(a)), and a significant net emissions increase (as defined in the definitions for "Net emissions increase" and "Significant" in Section 4(a)). The project is not a major modification if it does not cause a significant emissions increase. If the project causes a significant emissions increase, then the project is a major modification only if it also results in a significant net emissions increase.

(II) The procedure for calculating (before beginning actual construction) whether a significant emissions increase (i.e., the first step of the process) will occur depends upon the type of emissions units being modified, according to paragraphs (b)(i)(J)(III) through (V) of this section. The procedure for calculating (before beginning actual construction) whether a significant net emissions increase will occur at the major stationary source (i.e., the second step of the process) is contained in the definition for "Net emissions increase" in Section 4(a). Regardless of any such preconstruction projections, a major modification results if the project causes a significant emissions increase and a significant net emissions increase.

(III) Actual-to-Projected-Actual Applicability Test For Projects That Only Involve Existing Emissions Units. A significant emissions increase of a regulated NSR pollutant is projected to occur if the sum of the difference between the projected actual emissions (as defined in the definition for "Projected actual emissions" in Section 4(a)) and the baseline actual emissions (as defined in paragraphs (i) and (ii) in the definition of "Baseline actual emissions" in Section 4(a)) for each existing emissions unit, equals or exceeds the significant amount for that pollutant (as defined in the definition of "Significant" in Section 4(a)).

(IV) Actual-to-Potential Test For Projects That Only Involve Construction of a New Emissions Unit(s). A significant emissions increase of a regulated NSR pollutant is projected to occur if the sum of the difference between the potential to emit (as defined in the definition for “Potential to emit” in Section 4(a)) from each new emissions unit following completion of the project and the baseline actual emissions (as defined in paragraph (iii) for the definition of “Baseline actual emissions” in Section 4(a)) of these units before the project equals or exceeds the significant amount for that pollutant (as defined in the definition of “Significant” in Section 4(a)).

(V) Hybrid Test For Projects That Involve Multiple Types of Emissions Units. A significant emissions increase of a regulated NSR pollutant is projected to occur if the sum of the emissions increases for each emissions unit, using the method specified in paragraphs (b)(i)(J)(III) and (IV) of this section as applicable with respect to each emissions unit, for each type of emissions unit equals or exceeds the significant amount for that pollutant (as defined in the definition of “Significant” in Section 4(a)).

(ii) (A) The required permit shall not be issued unless the proposed major stationary source or major modification would meet an emission limit(s) or equipment standard(s) specified by the Administrator to represent the application of Best Available Control Technology for each pollutant regulated under these Standards and Regulations and under the Federal Clean Air Act and having the potential to emit in significant amounts. For phased construction projects, the determination of BACT shall be reviewed and modified as appropriate at the latest, most reasonable time no later than 18 months prior to commencement of each phase of the proposed project. At such time, the owner or operator of the applicable stationary source may be required to demonstrate the adequacy of any previous determination of best available control technology for the stationary source.

(B) In the case of a major modification, the requirements for Best Available Control Technology shall apply only to each new or modified emissions unit at which a net emissions increase of the pollutant would occur.

(C) (I) The applicant for a permit for a source subject to this section may petition the Administrator to approve a system of innovative control technology.

(II) The Administrator, with the approval of the governor(s) of other affected state(s) may approve the employment of a system of innovative control technology if:

(1.) The proposed control system would not cause or contribute to an unreasonable risk to public health, welfare, or safety in its operation or function;

(2.) The owner or operator agrees to achieve a level of continuous emissions reduction equivalent to that which would have been required under paragraphs (ii)(A) and (B) above by a date specified by the Administrator. Such date shall not be later than 4 years from the time of startup or 7 years from permit issuance.

(3.) The major stationary source or major modification would meet the requirements equivalent to those in paragraphs (b)(i)(A)(I), (b)(ii)(A), and (b)(ii)(B) above based on the emission rate that the stationary source employing the system of innovative control technology would be required to meet on the date specified by the Administrator.

(4.) The source or modification would not before the date specified by the Administrator:

a. Cause or contribute to any violation of an applicable National Ambient Air Quality Standard, or

b. Impact any Class I Area, or

c. Impact any area where an applicable increment is known to be violated.

(5.) All other applicable requirements including those for public participation have been met.

(III) The approval to employ a system of innovative control technology shall be withdrawn by the Administrator if:

(1.) The proposed system fails by the specified date to achieve the required continuous emissions reduction rate, or

(2.) The proposed system fails before the specified date so as to contribute to an unreasonable risk to public health, welfare, or safety, or

(3.) The Administrator decides at any time that the proposed system is unlikely to achieve the required level of control or to protect the public health, welfare, or safety.

(IV) If the source or modification fails to meet the required level of continuous emissions reduction within the specified time period or if the approval is withdrawn in accordance with (III) above, the Administrator may allow the source or

modification up to an additional three years to meet the requirement for the application of BACT through use of a demonstrated system of control.

(iii) Temporary particulate matter emissions such as those associated with the construction phase of the source shall not be included in the determination on the issuance or denial of a required permit and shall not be taken into account when determining compliance with the maximum allowable increments in Table 1; however, Best Available Control Technology shall be applied to abate such temporary emission.

(iv) All applications of air quality modeling required under paragraph (b)(i) above shall be based on the applicable models, databases, and other requirements specified in Appendix W of 40 CFR part 51 (Guideline on Air Quality Models). Where an air quality model specified in Appendix W of 40 CFR part 51 (Guideline on Air Quality Models) is inappropriate, the model may be modified or another model substituted. Such a modification or substitution of a model may be made on a case-by-case basis or, where appropriate, on a generic basis for a specific State of Wyoming program. Written approval of the EPA Administrator must be obtained for any modification or substitution. In addition, use of a modified or substituted model must be subject to notice and opportunity for public comment under procedures set forth in Chapter 6, Section 2(g).

(v) In any case where the federal official charged with direct responsibility for management of any lands within a Class I Area, or the Administrator of EPA or the governor of an adjacent state containing such a Class I Area, files a notice alleging that emissions from a proposed source or major modification may cause or contribute to a change in the air quality in such area and identifying the potential adverse impact of such change, a permit shall not be issued unless the owner or operator of such source demonstrates to the satisfaction of the Administrator that emissions of particulate matter, sulfur dioxide, and nitrogen oxides will not cause or contribute to concentrations which exceed the maximum allowable increases for the Class I Area in question.

(vi) (A) In any case where a Federal Land Manager demonstrates to the satisfaction of the Administrator that the emissions from such source will have an adverse impact on the air quality-related values (including visibility) of such Class I Areas, notwithstanding the fact that the change in air quality resulting from emissions from such source will not cause or contribute to concentrations which exceed the maximum allowable increases for Class I Areas, a permit shall not be issued.

(B) However, in the case where the Federal Land Manager provides to the Division at least 30 days prior to the Public Notice issued pursuant to Chapter 6, Section 2(m) of these regulations, an analysis of the impact of the emissions on visibility in a Federal Class I Area, the Division must consider such analysis in making its proposed decision. If the Federal Land Manager's analysis concludes that an adverse impact on visibility in the Federal Class I Area will occur but the Administrator

determines that the analysis does not demonstrate to his satisfaction that such an adverse impact on visibility will occur, the Administrator shall in the Public Notice issued pursuant to the requirements of Chapter 6, Section 2(m), explain his decision or give notice as to where the explanation can be obtained.

(vii) In any case where the owner or operator of such source demonstrates to the satisfaction of the Federal Land Manager, and the Federal Land Manager so certifies, that the emissions from such source will have no adverse impact on the air quality-related values of such Class I Areas (including visibility) notwithstanding the fact that the change in air quality resulting from emissions from such source will cause or contribute to concentrations which exceed the maximum allowable increases for Class I Areas, the Administrator may issue a permit.

(viii) In the case of a permit issued pursuant to subsection (vii), such source shall comply with such emission limitation under such permit as may be necessary to assure that emissions of sulfur oxides, particulate matter, and nitrogen oxides from such source, will not cause or contribute to concentrations of such pollutant which exceeds the following maximum allowable increases over the baseline concentration for such pollutants:

	Maximum Allowable Increase (micrograms per cubic meter)
Particulate matter:	
PM ₁₀ , annual arithmetic mean	17
PM ₁₀ , 24-hour maximum	30
Sulfur dioxide:	
Annual arithmetic mean	20
Twenty-four-hour maximum	91
Three-hour maximum	325
Nitrogen dioxide:	
Annual arithmetic mean	25

(ix) (A) In any case where the owner or operator of a proposed major stationary source or major modification who has been denied a certification under subparagraph (vii) demonstrates to the satisfaction of the Governor of Wyoming (hereinafter the Governor), after notice and public hearing, and the Governor finds, that the source cannot be constructed by reason of any maximum allowable increases for sulfur dioxide for periods of twenty-four hours or less applicable to any Class I Area and, in the case of federal Mandatory Class I Areas, that a variance under this clause will not adversely affect the air quality related values of the area (including visibility), the Governor, after consideration of the Federal Land Manager's recommendation (if any) and subject to his concurrence, may grant a variance from such maximum allowable increase. If a variance is granted, a permit may be issued to such source pursuant to the requirements of this subparagraph provided other requirements of this section are met.

(B) In the case of a permit issued pursuant to subparagraph (ix)(A), such source shall comply with such emission limitations under such permit as may be necessary to assure that emissions of sulfur oxides from such source will not (during any day on which the otherwise applicable maximum allowable increases are exceeded) cause or contribute to concentrations which exceed the following maximum allowable increases for such areas over the baseline concentration for such pollutant and to assure that such emissions will not cause or contribute to concentrations which exceed the otherwise applicable maximum allowable increases for periods of exposure of 24 hours or less on more than 18 days during any annual period.

	Maximum Allowable Increase (micrograms per cubic meter)
Period of exposure:	
Low terrain areas:	
24-hr maximum	36
3-hr maximum	130
High terrain areas:	
24-hr. maximum	62
3-hr maximum	221

(x) Notwithstanding other requirements of this section, a portable source which is a major stationary source and which has otherwise received a construction permit under Chapter 6, Sections 2 and 4 shall not be required to obtain additional relocation permits under this section if:

(A) Emissions from the source would not exceed allowable emissions; and

(B) Such relocation would impact no Class I Area and no area where an applicable increment is known to be violated; and

(C) Notice is given to the Division at least 10 days prior to such relocation identifying the proposed new location and the probable duration of operation at such location; and

(D) Emissions at the new location will be temporary.

(xi) After a final decision is made on an application for a source subject to this section, the final decision will be transmitted in writing to the applicant and the final decision and all comments received by the Division during the public comment period will be made available for public inspection in the same location where the application and analysis was posted. A copy of each permit application for each source or modification subject to this section and impacting a Federal Class I Area will be

transmitted to EPA. EPA will be provided with notice of each action taken by the Division on such application.

(xii) [Reserved.]

(xiii) [Reserved.]

(xiv) [Reserved.]

(xv) Actuals Plantwide Applicability Limitations (PALs).

(A) Applicability.

(I) The Division may approve the use of an actuals PAL for any existing major stationary source if the PAL meets the requirements in paragraphs (b)(xv)(A) through (O) of this section. The term “PAL” shall mean “actuals PAL” throughout paragraph (b)(xv) of this section.

(II) Any physical change in or change in the method of operation of a major stationary source that maintains its total source-wide emissions below the PAL level, meets the requirements in paragraphs (b)(xv)(A) through (O) of this section, and complies with the PAL permit:

(1.) Is not a major modification for the PAL pollutant;

(2.) Does not have to be approved through a Chapter 6, Section 4 permit; and

(3.) Is not subject to the provisions in paragraph (b)(i)(G) of this section (restrictions on relaxing enforceable emission limitations that the major stationary source used to avoid applicability of Chapter 6, Section 4).

(III) Except as provided under paragraph (b)(xv)(A)(II)(3.) of this section, a major stationary source shall continue to comply with all applicable Federal or State of Wyoming requirements, emission limitations, and work practice requirements that were established prior to the effective date of the PAL.

(B) Definitions. The following definitions shall be used for actuals PALs consistent with paragraphs (b)(xv)(A) through (O) of this section. When a term is not defined in these paragraphs, it shall have the meaning given in Section 4(a) of this section or in the Clean Air Act.

“Actuals PAL for a major stationary source” means a PAL based on the baseline actual emissions (as defined in the definition for “Baseline actual emissions” in Section 4(a)) of all emissions units (as defined in the definition for “Source” in Section 4(a)) at the source, that emit or have the potential to emit the PAL pollutant.

“Allowable emissions” has the same meaning as in the definition for “Allowable emissions” in Section 4(a), except as this definition is modified according to paragraphs (i) and (ii) of this definition.

(i) The allowable emissions for any emissions unit shall be calculated considering any emission limitations that are enforceable as a practical matter on the emissions unit’s potential to emit.

(ii) An emissions unit’s potential to emit shall be determined using the definition of “Potential to emit” in Section 4(a), except that the words “or enforceable as a practical matter” should be added after “enforceable”.

“Major emissions unit” means:

(i) Any emissions unit that emits or has the potential to emit 100 tons per year or more of the PAL pollutant in an attainment area; or

(ii) Any emissions unit that emits or has the potential to emit the PAL pollutant in an amount that is equal to or greater than the major source threshold for the PAL pollutant as defined by the Clean Air Act for nonattainment areas. (For example, in accordance with the definition of major stationary source in section 182(c) of the Clean Air Act, an emissions unit would be a major emissions unit for VOC if the emissions unit is located in a serious ozone nonattainment area and it emits or has the potential to emit 50 or more tons of VOC per year.)

“PAL effective date” generally means the date of issuance of the PAL permit; however, the PAL effective date for an increased PAL is the date any emissions unit that is part of the PAL major modification becomes operational and begins to emit the PAL pollutant.

“PAL effective period” means the period beginning with the PAL effective date and ending 10 years later.

“PAL major modification” means, notwithstanding the definitions for “Major modification” and “Net emissions increase” of Section 4(a), any physical change in or change in the method of operation of the PAL source that causes it to emit the PAL pollutant at a level equal to or greater than the PAL.

“PAL permit” means the Chapter 6, Section 2 or Section 4 permit issued by the Division that establishes a PAL for a major stationary source.

“PAL pollutant” means the pollutant for which a PAL is established at a major stationary source.

“Plantwide applicability limitation (PAL)” means an emission limitation expressed in tons per year, for a pollutant at a major stationary source, that is enforceable as a practical matter and established source-wide in accordance with paragraphs (b)(xv)(A) through (O) of this section.

“Significant emissions unit” means an emissions unit that emits or has the potential to emit a PAL pollutant in an amount that is equal to or greater than the significant level (as defined in the definition for “Significant” in Section 4(a) or in the Clean Air Act, whichever is lower) for that PAL pollutant, but less than the amount that would qualify the unit as a major emissions unit as defined in paragraph (b)(xv)(B) for the definition of “Major emissions unit” of this section.

“Small emissions unit” means an emissions unit that emits or has the potential to emit the PAL pollutant in an amount less than the significant level for that PAL pollutant, as defined in the definition for “Significant” in Section 4(a) or in the Clean Air Act, whichever is lower.

(C) Permit Application Requirements. As part of a permit application requesting a PAL, the owner or operator of a major stationary source shall submit the following information in paragraphs (b)(xv)(C)(I) through (III) of this section to the Division for approval.

(I) A List of All Emissions Units at the Source Designated as Small, Significant or Major Based on Their Potential to Emit. In addition, the owner or operator of the source shall indicate which, if any, Federal or State of Wyoming applicable requirements, emission limitations, or work practices apply to each unit.

(II) Calculations of the Baseline Actual Emissions (With Supporting Documentation). Baseline actual emissions are to include emissions associated not only with operation of the unit, but also emissions associated with startup, shutdown, and malfunction.

(III) The calculation procedures that the major stationary source owner or operator proposes to use to convert the monitoring system data to monthly emissions and annual emissions based on a 12-month rolling total for each month as required by paragraph (b)(xv)(M)(I) of this section.

(D) General Requirements For Establishing PALs.

(I) The Division may establish a PAL at a major stationary source, provided that at a minimum, the requirements in paragraphs (b)(xv)(D)(I)(1.) through (7.) of this section are met.

(1.) The PAL shall impose an annual emission limitation in tons per year, that is enforceable as a practical matter, for the entire major stationary source. For each month during the PAL effective period after the first 12 months of establishing a PAL, the major stationary source owner or operator shall show that the sum of the monthly emissions from each emissions unit under the PAL for the previous 12 consecutive months is less than the PAL (a 12-month average, rolled monthly). For each month during the first 11 months from the PAL effective date, the major stationary source owner or operator shall show that the sum of the preceding monthly emissions from the PAL effective date for each emissions unit under the PAL is less than the PAL.

(2.) The PAL shall be established in a PAL permit that meets the public participation requirements in paragraph (b)(xv)(E) of this section.

(3.) The PAL permit shall contain all the requirements of paragraph (b)(xv)(G) of this section.

(4.) The PAL shall include fugitive emissions, to the extent quantifiable, from all emissions units that emit or have the potential to emit the PAL pollutant at the major stationary source.

(5.) Each PAL shall regulate emissions of only one pollutant.

(6.) Each PAL shall have a PAL effective period of 10 years.

(7.) The owner or operator of the major stationary source with a PAL shall comply with the monitoring, recordkeeping, and reporting requirements provided in paragraphs (b)(xv)(L) through (N) of this section for each emissions unit under the PAL through the PAL effective period.

(II) At no time (during or after the PAL effective period) are emissions reductions of a PAL pollutant that occur during the PAL effective period creditable as decreases for purposes of offsets under 40 CFR Part 51.165(a)(3)(ii) unless the level of the PAL is reduced by the amount of such emissions reductions and such reductions would be creditable in the absence of the PAL.

(E) Public Participation Requirements For PALs. PALs for existing major stationary sources shall be established, renewed, or increased, through a

procedure that is consistent with Chapter 6, Section 2. This includes the requirement that the Division provide the public with notice of the proposed approval of a PAL permit and at least a 30-day period for submittal of public comment. The Division must address all material comments before taking final action on the permit.

(F) Setting the 10-Year Actuals PAL Level.

(I) Except as provided in paragraph (b)(xv)(F)(II) of this section, the actuals PAL level for a major stationary source shall be established as the sum of the baseline actual emissions (as defined in the definition for “Baseline actual emissions” in Section 4(a)) of the PAL pollutant for each emissions unit at the source; plus an amount equal to the applicable significant level for the PAL pollutant under the definition of “Significant” in Section 4(a) or under the Clean Air Act, whichever is lower. When establishing the actuals PAL level, for a PAL pollutant, only one consecutive 24-month period must be used to determine the baseline actual emissions for all existing emissions units; however, a different consecutive 24-month period may be used for each different PAL pollutant. Emissions associated with units that were permanently shut down after this 24-month period must be subtracted from the PAL level. The Division shall specify a reduced PAL level(s) (in tons/yr) in the PAL permit to become effective on the future compliance date(s) of any applicable Federal or State of Wyoming regulatory requirement(s) that the Division is aware of prior to issuance of the PAL permit. For instance, if the source owner or operator will be required to reduce emissions from industrial boilers in half from baseline emissions of 60 ppm NO_x to a new rule limit of 30 ppm, then the permit shall contain a future effective PAL level that is equal to the current PAL level reduced by half of the original baseline emissions of such unit(s).

(II) For newly constructed units (which do not include modifications to existing units) on which actual construction began after the 24-month period, in lieu of adding the baseline actual emissions as specified in paragraph (b)(xv)(F)(I) of this section, the emissions must be added to the PAL level in an amount equal to the potential to emit of the units.

(G) Contents of the PAL Permit. The PAL permit shall contain, at a minimum, the information in paragraphs (b)(xv)(G)(I) through (X) of this section.

(I) The PAL pollutant and the applicable source-wide emission limitation in tons per year.

(II) The PAL permit effective date and the expiration date of the PAL (PAL effective period).

(III) Specification in the PAL permit that if a major stationary source owner or operator applies to renew a PAL in accordance with paragraph (b)(xv)(J) of this section before the end of the PAL effective period, then the PAL shall

not expire at the end of the PAL effective period. It shall remain in effect until a revised PAL permit is issued by the Division.

(IV) A requirement that emission calculations for compliance purposes include emissions from startups, shutdowns and malfunctions.

(V) A requirement that, once the PAL expires, the major stationary source is subject to the requirements of paragraph (b)(xv)(I) of this section.

(VI) The calculation procedures that the major stationary source owner or operator shall use to convert the monitoring system data to monthly emissions and annual emissions based on a 12-month rolling total for each month as required by paragraph (b)(xv)(C)(I) of this section.

(VII) A requirement that the major stationary source owner or operator monitor all emissions units in accordance with the provisions under paragraph (b)(xv)(M) of this section.

(VIII) A requirement to retain the records required under paragraph (b)(xv)(M) of this section on site. Such records may be retained in an electronic format.

(IX) A requirement to submit the reports required under paragraph (b)(xv)(N) of this section by the required deadlines.

(X) Any other requirements that the Division deems necessary to implement and enforce the PAL.

(H) PAL Effective Period and Reopening of the PAL Permit.

(I) PAL Effective Period. The PAL effective period shall be 10 years.

(II) Reopening of the PAL Permit.

(1.) During the PAL effective period, the Division shall reopen the PAL permit to:

a. Correct typographical/calculation errors made in setting the PAL or reflect a more accurate determination of emissions used to establish the PAL;

b. Reduce the PAL if the owner or operator of the major stationary source creates creditable emissions reductions for use as offsets under 40 CFR part 51.165(a)(3)(ii); and

c. Revise the PAL to reflect an increase in the PAL as provided under paragraph (b)(xv)(K) of this section.

(2.) The Division may reopen the PAL permit for the following:

a. Reduce the PAL to reflect newly applicable Federal requirements (for example, NSPS) with compliance dates after the PAL effective date;

b. Reduce the PAL consistent with any other requirement, that is enforceable as a practical matter, and that the Division may impose on the major stationary source; and

c. Reduce the PAL if the Division determines that a reduction is necessary to avoid causing or contributing to a NAAQS or PSD increment violation, or to an adverse impact on an AQRV that has been identified for a Federal Class I Area by a Federal Land Manager and for which information is available to the general public.

(3.) Except for the permit reopening in paragraph (b)(xv)(H)(II)(1.)a. of this section for the correction of typographical/calculation errors that do not increase the PAL level, all reopenings shall be carried out in accordance with the public participation requirements of paragraph (b)(xv)(E) of this section.

(I) Expiration of a PAL. Any PAL that is not renewed in accordance with the procedures in paragraph (b)(xv)(J) of this section shall expire at the end of the PAL effective period, and the requirements in paragraphs (b)(xv)(I)(I) through (V) of this section shall apply.

(I) Each emissions unit (or each group of emissions units) that existed under the PAL shall comply with an allowable emission limitation under a revised permit established according to the procedures in paragraphs (b)(xv)(I)(I)(1.) and (2.) of this section.

(1.) Within the time frame specified for PAL renewals in paragraph (b)(xv)(J)(II) of this section, the major stationary source shall submit a proposed allowable emission limitation for each emissions unit (or each group of emissions units, if such a distribution is more appropriate as decided by the Division) by distributing the PAL-allowable emissions for the major stationary source among each

of the emissions units that existed under the PAL. If the PAL had not yet been adjusted for an applicable requirement that became effective during the PAL effective period, as required under paragraph (b)(xv)(J)(V) of this section, such distribution shall be made as if the PAL had been adjusted.

(2.) The Division shall decide whether and how the PAL-allowable emissions will be distributed and issue a revised permit incorporating allowable limits for each emissions unit, or each group of emissions units, as the Division determines is appropriate.

(II) Each emissions unit(s) shall comply with the allowable emission limitation on a 12-month rolling basis. The Division may approve the use of monitoring systems (source testing, emission factors, etc.) other than CEMS, CERMS, PEMS or CPMS to demonstrate compliance with the allowable emission limitation.

(III) Until the Division issues the revised permit incorporating allowable limits for each emissions unit, or each group of emissions units, as required under paragraph (b)(xv)(I)(I)(2.) of this section, the source shall continue to comply with a source-wide, multi-unit emissions cap equivalent to the level of the PAL emission limitation.

(IV) Any physical change or change in the method of operation at the major stationary source will be subject to Chapter 6, Section 4 requirements if such change meets the definition of “Major modification” in Section 4(a).

(V) The major stationary source owner or operator shall continue to comply with any State of Wyoming or Federal applicable requirements (BACT, RACT, NSPS, etc.) that may have applied either during the PAL effective period or prior to the PAL effective period except for those emission limitations that had been established pursuant to paragraph (b)(i)(G) of this section, but were eliminated by the PAL in accordance with the provisions in paragraph (b)(xv)(A)(II)(3.) of this section.

(J) Renewal of a PAL.

(I) The Division shall follow the procedures specified in paragraph (b)(xv)(E) of this section in approving any request to renew a PAL for a major stationary source, and shall provide both the proposed PAL level and a written rationale for the proposed PAL level to the public for review and comment. During such public review, any person may propose a PAL level for the source for consideration by the Division.

(II) Application Deadline. A major stationary source owner or operator shall submit a timely application to the Division to request renewal of a PAL. A timely application is one that is submitted at least 6 months prior to, but not

earlier than 18 months from, the date of permit expiration. This deadline for application submittal is to ensure that the permit will not expire before the permit is renewed. If the owner or operator of a major stationary source submits a complete application to renew the PAL within this time period, then the PAL shall continue to be effective until the revised permit with the renewed PAL is issued.

(III) Application Requirements. The application to renew a PAL permit shall contain the information required in paragraphs (b)(xv)(J)(III)(1.) through (4.) of this section.

(1.) The information required in paragraphs (b)(xv)(C)(I) through (III) of this section.

(2.) A proposed PAL level.

(3.) The sum of the potential to emit of all emissions units under the PAL (with supporting documentation).

(4.) Any other information the owner or operator wishes the Division to consider in determining the appropriate level for renewing the PAL.

(IV) PAL Adjustment. In determining whether and how to adjust the PAL, the Division shall consider the options outlined in paragraphs (b)(xv)(J)(IV)(1.) and (2.) of this section; however, in no case may any such adjustment fail to comply with paragraph (b)(xv)(J)(IV)(3.) of this section.

(1.) If the emissions level calculated in accordance with paragraph (b)(xv)(F) of this section is equal to or greater than 80 percent of the PAL level, the Division may renew the PAL at the same level without considering the factors set forth in paragraph (b)(xv)(J)(IV)(2.) of this section; or

(2.) The Division may set the PAL at a level that it determines to be more representative of the source's baseline actual emissions, or that it determines to be appropriate considering air quality needs, advances in control technology, anticipated economic growth in the area, desire to reward or encourage the source's voluntary emissions reductions, or other factors as specifically identified by the Division in its written rationale.

(3.) Notwithstanding paragraphs (b)(xv)(J)(IV)(1.) and (2.) of this section:

a. If the potential to emit of the major stationary source is less than the PAL, the Division shall adjust the PAL to a level no greater than the potential to emit of the source; and

b. The Division shall not approve a renewed PAL level higher than the current PAL, unless the major stationary source has complied with the provisions of paragraph (b)(xv)(K) of this section (increasing a PAL).

(V) If the compliance date for a State of Wyoming or Federal requirement that applies to the PAL source occurs during the PAL effective period, and if the Division has not already adjusted for such requirement, the PAL shall be adjusted at the time of PAL permit renewal or Chapter 6, Section 3 operating permit renewal, whichever occurs first.

(K) Increasing a PAL During the PAL Effective Period.

(I) The Division may increase a PAL emission limitation only if the major stationary source complies with the provisions in paragraphs (b)(xv)(K)(I)(1.) through (4.) of this section.

(1.) The owner or operator of the major stationary source shall submit a complete application to request an increase in the PAL limit for a PAL major modification. Such application shall identify the emissions unit(s) contributing to the increase in emissions so as to cause the major stationary source's emissions to equal or exceed its PAL.

(2.) As part of this application, the major stationary source owner or operator shall demonstrate that the sum of the baseline actual emissions of the small emissions units, plus the sum of the baseline actual emissions of the significant and major emissions units assuming application of BACT equivalent controls, plus the sum of the allowable emissions of the new or modified emissions unit(s), exceeds the PAL. The level of control that would result from BACT equivalent controls on each significant or major emissions unit shall be determined by conducting a new BACT analysis at the time the application is submitted, unless the emissions unit is currently required to comply with a BACT or LAER requirement that was established within the preceding 10 years. In such a case, the assumed control level for that emissions unit shall be equal to the level of BACT or LAER with which that emissions unit must currently comply.

(3.) The owner or operator obtains a Chapter 6, Section 4 permit for all emissions unit(s) identified in paragraph (b)(xv)(K)(I)(1.) of this section, regardless of the magnitude of the emissions increase resulting from them (that is, no significant levels apply). These emissions unit(s) shall comply with any emissions

requirements resulting from the Chapter 6, Section 4 process (for example, BACT), even though they have also become subject to the PAL or continue to be subject to the PAL.

(4.) The PAL permit shall require that the increased PAL level shall be effective on the day any emissions unit that is part of the PAL major modification becomes operational and begins to emit the PAL pollutant.

(II) The Division shall calculate the new PAL as the sum of the allowable emissions for each modified or new emissions unit, plus the sum of the baseline actual emissions of the significant and major emissions units (assuming application of BACT equivalent controls as determined in accordance with paragraph (b)(xv)(K)(I)(2.) of this section), plus the sum of the baseline actual emissions of the small emissions units.

(III) The PAL permit shall be revised to reflect the increased PAL level pursuant to the public notice requirements of paragraph (b)(xv)(E) of this section.

(L) Monitoring Requirements for PALs.

(I) General Requirements.

(1.) Each PAL permit must contain enforceable requirements for the monitoring system that accurately determines plantwide emissions of the PAL pollutant in terms of mass per unit of time. Any monitoring system authorized for use in the PAL permit must be based on sound science and meet generally acceptable scientific procedures for data quality and manipulation. Additionally, the information generated by such system must meet minimum legal requirements for admissibility in a judicial proceeding to enforce the PAL permit.

(2.) The PAL monitoring system must employ one or more of the four general monitoring approaches meeting the minimum requirements set forth in paragraphs (b)(xv)(L)(II)(1.) through (4.) of this section and must be approved by the Division.

(3.) Notwithstanding paragraph (b)(xv)(L)(I)(2.) of this section, you may also employ an alternative monitoring approach that meets paragraph (b)(xv)(L)(I)(1.) of this section if approved by the Division.

(4.) Failure to use a monitoring system that meets the requirements of this section renders the PAL invalid.

(II) Minimum Performance Requirements For Approved Monitoring Approaches. The following are acceptable general monitoring approaches

when conducted in accordance with the minimum requirements in paragraphs (b)(xv)(L)(III) through (IX) of this section:

(1.) Mass balance calculations for activities using coatings or solvents;

(2.) CEMS;

(3.) CPMS or PEMS; and

(4.) Emission factors.

(III) Mass Balance Calculations. An owner or operator using mass balance calculations to monitor PAL pollutant emissions from activities using coating or solvents shall meet the following requirements:

(1.) Provide a demonstrated means of validating the published content of the PAL pollutant that is contained in or created by all materials used in or at the emissions unit;

(2.) Assume that the emissions unit emits all of the PAL pollutant that is contained in or created by any raw material or fuel used in or at the emissions unit, if it cannot otherwise be accounted for in the process; and

(3.) Where the vendor of a material or fuel, which is used in or at the emissions unit, publishes a range of pollutant content from such material, the owner or operator must use the highest value of the range to calculate the PAL pollutant emissions unless the Division determines there is site-specific data or a site-specific monitoring program to support another content within the range.

(IV) CEMS. An owner or operator using CEMS to monitor PAL pollutant emissions shall meet the following requirements:

(1.) CEMS must comply with applicable Performance Specifications found in 40 CFR part 60, Appendix B; and

(2.) CEMS must sample, analyze, and record data at least every 15 minutes while the emissions unit is operating.

(V) CPMS or PEMS. An owner or operator using CPMS or PEMS to monitor PAL pollutant emissions shall meet the following requirements:

(1.) The CPMS or the PEMS must be based on current site-specific data demonstrating a correlation between the monitored parameter(s) and the PAL pollutant emissions across the range of operation of the emissions unit; and

(2.) Each CPMS or PEMS must sample, analyze, and record data at least every 15 minutes, or at another less frequent interval approved by the Division, while the emissions unit is operating.

(VI) Emission Factors. An owner or operator using emission factors to monitor PAL pollutant emissions shall meet the following requirements:

(1.) All emission factors shall be adjusted, if appropriate, to account for the degree of uncertainty or limitations in the factors' development;

(2.) The emissions unit shall operate within the designated range of use for the emission factor, if applicable; and

(3.) If technically practicable, the owner or operator of a significant emissions unit that relies on an emission factor to calculate PAL pollutant emissions shall conduct validation testing to determine a site-specific emission factor within 6 months of PAL permit issuance, unless the Division determines that testing is not required.

(VII) A source owner or operator must record and report maximum potential emissions without considering enforceable emission limitations or operational restrictions for an emissions unit during any period of time that there is no monitoring data, unless another method for determining emissions during such periods is specified in the PAL permit.

(VIII) Notwithstanding the requirements in paragraphs (b)(xv)(L)(III) through (VIII) of this section, where an owner or operator of an emissions unit cannot demonstrate a correlation between the monitored parameter(s) and the PAL pollutant emissions rate at all operating points of the emissions unit, the Division shall, at the time of permit issuance:

(1.) Establish default value(s) for determining compliance with the PAL based on the highest potential emissions reasonably estimated at such operating point(s); or

(2.) Determine that operation of the emissions unit during operating conditions when there is no correlation between monitored parameter(s) and the PAL pollutant emissions is a violation of the PAL.

(IX) Re-validation. All data used to establish the PAL pollutant must be re-validated through performance testing or other scientifically valid means approved by the Division. Such testing must occur at least once every 5 years after issuance of the PAL.

(M) Recordkeeping Requirements.

(I) The PAL permit shall require an owner or operator to retain a copy of all records necessary to determine compliance with any requirement of paragraph (b)(xv) of this section and of the PAL, including a determination of each emissions unit's 12-month rolling total emissions, for 5 years from the date of such record.

(II) The PAL permit shall require an owner or operator to retain a copy of the following records, for the duration of the PAL effective period plus 5 years:

(1.) A copy of the PAL permit application and any applications for revisions to the PAL; and

(2.) Each annual certification of compliance pursuant to Chapter 6, Section 3 and the data relied on in certifying the compliance.

(N) Reporting and Notification Requirements. The owner or operator shall submit semi-annual monitoring reports and prompt deviation reports to the Division in accordance with the applicable Chapter 6, Section 3 operating permit program. The reports shall meet the requirements in paragraphs (b)(xv)(N)(I) through (III) of this section.

(I) Semi-annual Report. The semi-annual report shall be submitted to the Division within 30 days of the end of each reporting period. This report shall contain the information required in paragraphs (b)(xv)(N)(I)(1.) through (7.) of this section.

(1.) The identification of owner and operator and the permit number.

(2.) Total annual emissions (tons/year) based on a 12-month rolling total for each month in the reporting period recorded pursuant to paragraph (b)(xv)(M)(I) of this section.

(3.) All data relied upon, including, but not limited to, any Quality Assurance or Quality Control data, in calculating the monthly and annual PAL pollutant emissions.

(4.) A list of any emissions units modified or added to the major stationary source during the preceding 6-month period.

(5.) The number, duration, and cause of any deviations or monitoring malfunctions (other than the time associated with zero and span calibration checks), and any corrective action taken.

(6.) A notification of a shutdown of any monitoring system, whether the shutdown was permanent or temporary, the reason for the shutdown, the anticipated date that the monitoring system will be fully operational or replaced with another monitoring system, and whether the emissions unit monitored by the monitoring system continued to operate, and the calculation of the emissions of the pollutant or the number determined by method included in the permit, as provided by paragraph (b)(xv)(L)(VII) of this section.

(7.) A signed statement by the responsible official (as defined by the applicable Chapter 6, Section 3 operating permit program) certifying the truth, accuracy, and completeness of the information provided in the report.

(II) Deviation Report. The major stationary source owner or operator shall promptly submit reports of any deviations or exceedance of the PAL requirements, including periods where no monitoring is available. A report submitted pursuant to Chapter 6, Section 3(h)(i)(C)(III)(2.) shall satisfy this reporting requirement. The deviation reports shall be submitted within the time limits prescribed by Chapter 6, Section 3(h)(i)(C)(III)(2.). The reports shall contain the following information:

(1.) The identification of owner and operator and the permit number;

(2.) The PAL requirement that experienced the deviation or that was exceeded;

(3.) Emissions resulting from the deviation or the exceedance; and

(4.) A signed statement by the responsible official (as defined by the applicable Chapter 6, Section 3 operating permit program) certifying the truth, accuracy, and completeness of the information provided in the report.

(III) Re-validation Results. The owner or operator shall submit to the Division the results of any re-validation test or method within three months after completion of such test or method.

(O) Transition Requirements.

(I) The Division shall not issue a PAL that does not comply with the requirements in paragraphs (b)(xv)(A) through (O) of this section after the Administrator has approved regulations incorporating these requirements into Chapter 6, Section 4.

(II) The Division may supersede any PAL which was established prior to the date of approval of this regulation by the Administrator of EPA with a PAL that complies with the requirements of paragraphs (b)(xv)(A) through (O) of this section.

(xvi) If any provision of this section, or the application of such provision to any person or circumstance, is held invalid, the remainder of this section, or the application of such provision to persons or circumstances other than those as to which it is held invalid, shall not be affected thereby.

(xvii) Transition:

(A) The requirements for BACT in Chapter 6, Section 4(b)(ii) and the requirements for air quality analysis in Chapter 6, Section 4(b)(i) shall not apply to a major stationary source or major modification that was subject to Chapter 6, Section 4, as effective on January 25, 1979, if the owner or operator of the source submitted an application for a permit under these regulations before August 7, 1980, and the Administrator subsequently determines that the application submitted before that date was complete. Instead, the requirements of Chapter 6, Section 4 as in effect on January 25, 1979, apply to any such source or modification.

(B) The requirements for air quality monitoring in paragraph (b)(i)(E) shall not apply to a particular source or modification that was subject to Chapter 6, Section 4, as effective on January 25, 1979, if the owner or operator of the source or modification submits an application for a permit under these regulations on or before June 8, 1981, and the Administrator subsequently determines that the application submitted before that date was complete with respect to the requirements for ambient air quality data analyses as in effect on January 25, 1979. Instead, the latter requirements shall apply to such source or modification.

(C) The requirements for air quality monitoring in paragraph (b)(i)(E) shall not apply to a particular source or modification that was not subject to Chapter 6, Section 4, as effective on January 25, 1979, if the owner or operator of the source or modification submits an application for a permit under these regulations before June 8, 1981, and the Administrator subsequently determines that the application as submitted before that date was complete except with respect to the requirements in paragraph (b)(i)(F).

(D) The requirements for air quality monitoring for PM₁₀ in paragraphs (b)(i)(E)(I) through (IV) of this section, effective February 13, 1989, shall not apply to a particular source or modification, if the owner or operator of the source or modification submits an application for a permit under Chapter 6, Section 4 on or before June 1, 1988 and the Administrator subsequently determines that the application submitted before that date was complete, except with respect to the requirements for monitoring particulate matter.

(E) The requirements for air quality monitoring of PM₁₀ in paragraphs (b)(i)(E)(IV) through (b)(i)(E)(V) of this section, effective February 13, 1989, shall apply to a particular source or modification if the owner or operator of the source or modification submits an application for a permit under this section after June 1, 1988 and no later than December 1, 1988. The data shall have been gathered over at least the period from February 1, 1988 to the date the application becomes otherwise complete in accordance with the provisions set forth under paragraph (b)(xvii)(G) of this section, except that the Administrator may provide that the monitoring period specification may be reduced to a minimum of four months if he is satisfied that a complete and adequate analysis can be accomplished with monitoring data gathered over that shorter period of time.

(F) For any application under this section that becomes complete except as to the requirements of paragraphs (b)(i)(E)(III) and (b)(i)(E)(IV) pertaining to PM₁₀, after December 1, 1988 and no later than August 1, 1989, the data that paragraph (b)(i)(E)(III) requires will have been gathered over at least the period from August 1, 1988 to the date the application becomes otherwise complete. The Administrator may provide that the monitoring period specification may be reduced to a minimum of four months if he is satisfied that a complete and adequate analysis can be accomplished with monitoring data gathered over that shorter period of time.

(G) With respect to any requirements for air quality monitoring of PM₁₀ specified under paragraphs (b)(xvii)(D) and (b)(xvii)(E) of this section, effective February 13, 1989, the owner or operator of the source or modification shall use a monitoring method approved by the Administrator and shall estimate the ambient concentrations of PM₁₀ using the data collected by such approved monitoring method in accordance with estimating procedures approved by the Administrator.

(H) The requirement to demonstrate compliance with the maximum allowable increment for nitrogen dioxide shall not apply to a major stationary source or major modification that was subject to Chapter 6, Section 4, as effective on February 8, 1988, if the owner or operator of the source or modification submits an application for a permit under these regulations on or before October 30, 1990 and the Administrator subsequently determines that the application submitted before that date was complete.

(I) The requirement to demonstrate compliance with the maximum allowable increment for PM₁₀ shall not apply to a major stationary source or major modification that was subject to Chapter 6, Section 4, as effective on June 3, 1993, if the owner or operator of the source or modification submits an application for a permit under these regulations on or before the effective date of this regulation revision and the Administrator subsequently determines that the application submitted before that date was complete. Instead, the requirement to demonstrate compliance with the maximum allowable increment for TSP, as in effect at the time the application was submitted, shall apply:

Maximum Allowable Increments of Deterioration - $\mu\text{g}/\text{m}^3$

Pollutant	Class I	Class II
Particulate Matter:		
TSP, Annual geometric mean	5	19
TSP, 24-hour maximum*	10	37

*Maximum allowable increment may be exceeded once per year at any receptor site.

(c) All national parks, national wilderness areas, and national memorial parks in Wyoming as of January 25, 1979, shall be designated Class I and may not be redesignated. All other areas of the State of Wyoming shall be designated Class II as of the effective date of this regulation.

(d) Redesignation. All redesignation of areas within the State of Wyoming shall be accomplished through the process of establishment of Standards and Regulations set forth in the Wyoming Environmental Quality Act.

(i) The following areas may be redesignated only as Class I or Class II

Areas:

(A) An area which exceeds 10,000 acres in size and is a national monument, a national primitive area, a national preserve, a national recreational area, a national wild and scenic river, a national wildlife refuge, a national lakeshore, and

(B) A national park or national wilderness area which exceeds 10,000 acres in size and is established after the effective date of this regulation.

(ii) Except as provided in paragraph (c) above, any area may be redesignated as Class I or II, with the approval of the Administrator of the Environmental Protection Agency, in accordance with the provisions of paragraph (iii) below; provided, however, that lands within the exterior boundaries of reservations of federally recognized

Indian tribes may be redesignated to any class, but only by the appropriate Indian governing body.

(iii) (A) At least one public hearing must be held in accordance with the provisions for adoption of regulations as set forth in the Administrative Procedures Act and the Wyoming Environmental Quality Act.

(B) At least 30 days prior to the public hearing, a description and analysis of the health, environmental, economic, social and energy effects of the proposed redesignation shall be prepared and made available for public inspection. Any person petitioning the Department or Council to redesignate an area shall be responsible for preparing or submitting such description and analysis. Such persons shall also be responsible for revising this required documentation to the extent necessary to satisfy the Administrator of the U.S. EPA. The notice of the public hearing shall contain appropriate notification of the availability of the description and analysis of the proposed redesignation.

(C) Agencies from neighboring states, Indian governing bodies, Federal Land Managers, and local governments whose land may be affected by the proposed redesignation shall be notified at least 30 days prior to the hearing.

(D) Prior to proposing a redesignation, the Division and the Air Quality Advisory Board shall consult with the elected leadership of local and other substate general purpose governments in the area covered by the redesignation.

(E) Prior to public notice of the proposed redesignation the Division shall provide written notice to any Federal Land Manager who may be responsible for any federal lands within the area proposed for such redesignation and shall afford adequate opportunity (but not in excess of 60 days) to confer with the State respecting the intended notice of designation. The Federal Land Manager shall be offered the opportunity to submit written comments and recommendations with respect to such intended notice of redesignation. In redesignating any area with respect to which the federal land manager has submitted written comments and recommendations, the Division will publish a list of any inconsistency between such redesignation and such recommendation with an explanation of such inconsistency (together with the reasons for making such redesignation against the recommendation of the Federal Land Manager).

(F) The Council shall review and examine the description and analysis prepared pursuant to subparagraph (iii)(B) above prior to any redesignation.

(iv) (A) If an area has been proposed for redesignation to a more stringent class, no permit to construct may be granted to a source which may cause an impact in the area proposed for redesignation and for which an application to construct is received by the Division after the filing of the petition for redesignation with the

Environmental Quality Council until the proposed redesignation has been acted upon; however, approval may be granted if, in the Administrator's judgment, the proposed source would not violate the applicable increments of the proposed redesignation. Such approval shall be withheld only so long as in the Administrator's judgment, the petitioner is expeditiously proceeding toward development of the "description and analysis" required under (iii)(B) above, and provided that such "description and analysis" is complete and submitted to the Council for action on the petition within 18 months of the filing of the initial petition. Upon good cause shown, the Council may extend the foregoing deadline.

(B) Where an application for a permit to construct a source has been received by the Division prior to the receipt by the Council of a petition for redesignation of an area to a more stringent class and where such source may cause an impact in the area proposed for redesignation, the permit application shall be processed considering the classification of an area which existed at the time of permit application. For purposes of establishing a priority date under this Chapter 6, Section 4(d)(vi)(B), (1) such permit application is not required to meet the provisions for completeness in Chapter 6, Section 2, and (2) the time frames in Chapter 6, Section 2(g) for action on applications shall not apply.

However, a priority date established under Chapter 6, Section 4(d)(vi)(B), shall remain in effect only so long as in the Administrator's judgment, the applicant is expeditiously proceeding toward the development and submittal of such other information and data as required to make the application complete under the provisions of Chapter 6, Section 2, and provided that such other information and data is submitted to, and judged to be complete by the Administrator within 18 months of the filing of the initial permit application. Upon good cause shown, the Administrator may extend the foregoing deadline.

Section 5. Permit requirements for construction and modification of NESHAPs sources.

(a) (i) Applicability.

(A) This section implements the preconstruction review requirements of section 112(i)(1) for sources subject to a relevant emission standard that has been promulgated under Chapter 5, Section 3. In addition, this subsection includes other requirements for constructed and reconstructed stationary sources that are or become subject to a relevant promulgated emission standard.

(B) After the effective date of a relevant standard, the requirements in this subsection apply to owners or operators who construct a new source or reconstruct a source after the proposal date of that standard. New or reconstructed sources that start up before the standard's effective date are not subject to the

preconstruction review requirements specified in paragraphs (ii)(B), (iii), and (iv) of this subsection.

(ii) Requirements for Existing, Newly Constructed, and Reconstructed Sources.

(A) Upon construction an affected source is subject to relevant standards for new sources, including compliance dates. Upon reconstruction, an affected source is subject to relevant standards for new sources, including compliance dates, irrespective of any change in emissions of hazardous air pollutants from that source.

(B) After the effective date of any relevant standard, no person may construct a new major affected source or reconstruct a major affected source subject to such standard, or reconstruct a major source such that the source becomes a major affected source subject to the standard, without obtaining written approval, in advance, from the Administrator in accordance with the procedures specified in paragraphs (iii) and (iv) of this subsection.

(C) After the effective date of any relevant standard, no person may construct a new affected source or reconstruct an affected source subject to such standard, or reconstruct a source such that the source becomes an affected source subject to the standard, without notifying the Administrator of the intended construction or reconstruction. The notification shall be submitted in accordance with the procedures in Chapter 5, Section 3(k)(ii) and shall include all the information required for an application for approval of construction or reconstruction as specified in paragraph (iii) of this subsection. For major sources, the application for approval of construction or reconstruction may be used to fulfill the notification requirements of this subparagraph.

(D) After the effective date of any relevant standard, no person may operate such source without complying with the provisions of this section and the relevant standard unless that person has received an extension of compliance or an exemption from compliance under Chapter 5, Section 3(h)(viii) or Section 3(h)(ix).

(E) After the effective date of any relevant standard, equipment added (or a process change) to an affected source that is within the scope of the definition of affected source under the relevant standard shall be considered part of the affected source and subject to all provisions of the relevant standard established for that affected source. If a new affected source is added to the facility, the new affected source shall be subject to all the provisions of the relevant standard that are established for new sources including compliance dates.

(iii) Application for Approval of Construction or Reconstruction. The provisions of this paragraph implement section 112(i)(1) of the Act.

(A) General Application Requirements.

(I) An owner or operator who is subject to the requirements of paragraph (ii)(B) of this subsection shall submit to the Administrator an application for approval of the construction of a new major affected source, the reconstruction of a major affected source, or the reconstruction of a major source such that the source becomes a major affected source subject to the standard. The application shall be submitted in accordance with Chapter 6, Section 2 requirements before the construction or reconstruction is planned to commence. The application for approval of construction or reconstruction may be used to fulfill the initial notification requirements of Chapter 5, Section 3(k)(ii)(E). The owner or operator may submit the application for approval well in advance of the date construction or reconstruction is planned to commence in order to ensure a timely review by the Administrator and that the planned commencement date will not be delayed.

(II) A separate application shall be submitted for each construction or reconstruction. Each application for approval of construction or reconstruction shall include at a minimum:

- (1.) The applicant's name and address;
- (2.) A notification of intention to construct a new major affected source or make any physical or operational change to a major affected source that may meet or has been determined to meet the criteria for a reconstruction, as defined in Chapter 5, Section 3(e);
- (3.) The address (i.e., physical location) or proposed address of the source;
- (4.) An identification of the relevant standard that is the basis of the application;
- (5.) The expected commencement date of the construction or reconstruction;
- (6.) The expected completion date of the construction or reconstruction;
- (7.) The anticipated date of (initial) startup of the source;
- (8.) The type and quantity of hazardous air pollutants emitted by the source, reported in units and averaging times and in accordance with the test methods specified in the relevant standard, or if actual emissions data are not

yet available, an estimate of the type and quantity of hazardous air pollutants expected to be emitted by the source reported in units and averaging times specified in the relevant standard. The owner or operator may submit percent reduction information if a relevant standard is established in terms of percent reduction. However, operating parameters, such as flow rate, shall be included in the submission to the extent that they demonstrate performance and compliance; and

(9.) Other information as specified in paragraphs (iii)(B) and (iii)(C) of this subsection.

(III) An owner or operator who submits estimates or preliminary information in place of the actual emissions data and analysis required in paragraphs (iii)(A)(II)(8.) and (iii)(B) of this subsection shall submit the actual, measured emissions data and other correct information as soon as available but not later than with the notification of compliance status required in Chapter 5, Section 3(k)(viii) [see Chapter 5, Section 3(k)(viii)(D)].

(B) Application for Approval of Construction. Each application for approval of construction shall include, in addition to the information required in paragraph (iii)(A)(II) of this subsection, technical information describing the proposed nature, size, design, operating design capacity, and method of operation of the source, including an identification of each point of emission for each hazardous air pollutant that is emitted (or could be emitted) and a description of the planned air pollution control system (equipment or method) for each emission point. The description of the equipment to be used for the control of emissions shall include each control device for each hazardous air pollutant and the estimated control efficiency (percent) for each control device. The description of the method to be used for the control of emissions shall include an estimated control efficiency (percent) for that method. Such technical information shall include calculations of emission estimates in sufficient detail to permit assessment of the validity of the calculations. An owner or operator who submits approximations of control efficiencies under this subparagraph shall submit the actual control efficiencies as specified in paragraph (iii)(A)(III) of this subsection.

(C) Application for Approval of Reconstruction. Each application for approval of reconstruction shall include, in addition to the information required in paragraph (iii)(A)(II) of this subsection:

(I) A brief description of the affected source and the components that are to be replaced;

(II) A description of present and proposed emission control systems (i.e., equipment or methods). The description of the equipment to be used for the control of emissions shall include each control device for each hazardous air pollutant and the estimated control efficiency (percent) for each control device. The description of

the method to be used for the control of emissions shall include an estimated control efficiency (percent) for that method. Such technical information shall include calculations of emission estimates in sufficient detail to permit assessment of the validity of the calculations;

(III) An estimate of the fixed capital cost of the replacements and of constructing a comparable entirely new source;

(IV) The estimated life of the affected source after the replacements; and

(V) A discussion of any economic or technical limitations the source may have in complying with relevant standards or other requirements after the proposed replacements. The discussion shall be sufficiently detailed to demonstrate to the Administrator's satisfaction that the technical or economic limitations affect the source's ability to comply with the relevant standard and how they do so.

(VI) If in the application for approval of reconstruction the owner or operator designates the affected source as a reconstructed source and declares that there are no economic or technical limitations to prevent the source from complying with all relevant standards or other requirements, the owner or operator need not submit the information required in subparagraphs (iii)(C)(III) through (V) of this subsection, above.

(D) Additional Information. The Administrator may request additional relevant information after the submittal of an application for approval of construction or reconstruction.

(iv) Approval of Construction or Reconstruction.

(A) (I) If the Administrator determines that, if properly constructed, or reconstructed, and operated, a new or existing source for which an application under paragraph (iii) of this subsection was submitted will not cause emissions in violation of the relevant standard(s) and any other federally enforceable requirements, the Administrator will approve the construction or reconstruction through issuance of a construction or reconstruction permit for the source.

(II) In addition, in the case of reconstruction, the Administrator's determination under this paragraph will be based on:

(1.) The fixed capital cost of the replacements in comparison to the fixed capital cost that would be required to construct a comparable entirely new source;

(2.) The estimated life of the source after the replacements compared to the life of a comparable entirely new source;

(3.) The extent to which the components being replaced cause or contribute to the emissions from the source; and

(4.) Any economic or technical limitations on compliance with relevant standards that are inherent in the proposed replacements.

(B) (I) The Administrator will notify the owner or operator in writing of approval or intention to deny approval of construction or reconstruction within 60 calendar days after receipt of sufficient information to evaluate an application submitted under paragraph (iii) of this subsection. The 60-day approval or denial period will begin after the owner or operator has been notified in writing that the application is complete. The Administrator will notify the owner or operator in writing of the status of the application, that is, whether the application contains sufficient information to make a determination, within 30 calendar days after receipt of the original application and within 30 calendar days after receipt of any supplementary information that is submitted.

(II) When notifying the owner or operator that the application is not complete, the Administrator will specify the information needed to complete the application and provide notice of opportunity for the applicant to present, in writing, within 30 calendar days after notification of the incomplete application, additional information or arguments to the Administrator to enable further action on the application.

(C) Before denying any application for approval of construction or reconstruction, the Administrator will notify the applicant of the Administrator's intention to issue the denial together with:

(I) Notice of the information and findings on which the intended denial is based; and

(II) Notice of opportunity for the applicant to present, in writing, within 30 calendar days after notification of the intended denial, additional information or arguments to the Administrator to enable further action on the application.

(D) A final determination to deny any application for approval will be in writing and will specify the ground on which the denial is based. The final determination will be made within 60 calendar days of presentation of additional information or arguments (if the application is complete), or within 60 calendar days after the final date specified for presentation if no presentation is made.

(E) Neither the submission of an application for approval nor the Administrator's approval of construction or reconstruction shall:

(I) Relieve an owner or operator of legal responsibility for compliance with any applicable provisions of this section or with any other applicable Federal, State, or local requirement; or

(II) Prevent the Administrator from implementing or enforcing this section or taking any other action under the Wyoming Environmental Quality Act.

(v) Approval of Construction or Reconstruction Based on Prior State Preconstruction Review.

(A) The Administrator may approve an application for construction or reconstruction specified in paragraphs (ii)(B) and (iii) of this section if the owner or operator of a new or reconstructed source who is subject to such requirement demonstrates to the Administrator's satisfaction that the following conditions have been (or will be) met:

(I) The owner or operator of the new or reconstructed source has undergone a preconstruction review and approval process under Chapter 6, Section 2 before the promulgation date of the relevant standard and has received a federally enforceable construction permit that contains a finding that the source will meet the relevant emission standard as proposed, if the source is properly built and operated;

(II) In making its finding, the State has considered factors substantially equivalent to those specified in paragraph (iv)(A) of this section; and either

(III) The promulgated standard is no more stringent than the proposed standard in any relevant aspect that would affect the Administrator's decision to approve or disapprove an application for approval of construction or reconstruction under this section; or

(IV) The promulgated standard is more stringent than the proposed standard but the owner or operator will comply with the standard as proposed during the 3-year period immediately following the effective date of the standard as allowed for in Chapter 5, Section 3(h)(ii)(C).

(B) The owner or operator shall submit to the Administrator the request for approval of construction or reconstruction under this paragraph no later than the application deadline specified in paragraph (iii)(A) of this section [see also Chapter 5, Section 3(k)(ii)(B)]. The owner or operator shall include in the request information sufficient for the Administrator's determination. The Administrator will evaluate the

owner or operator's request in accordance with the procedures specified in paragraph (iv) of this section. The Administrator may request additional relevant information after the submittal of a request for approval of construction or reconstruction under this paragraph.

Section 6. Permit requirements for case-by-case maximum achievable control technology (MACT) determination.

(a) Applicability. The requirements of this section carry out section 112(g)(2)(B) of the Clean Air Act, as amended in 1990.

(b) Overall Requirements. The requirements of this section apply to any owner or operator who constructs or reconstructs a major source of hazardous air pollutants after the effective date of this section unless the major source in question has been specifically regulated or exempted from regulation under a standard issued pursuant to section 112(d), section 112(h), or section 112(j) and incorporated in 40 CFR part 63 or Chapter 5, Section 3, or the owner or operator of such major source has received all necessary air quality permits for such construction or reconstruction project before the effective date of this section.

(c) Exclusion for Electric Utility Steam Generating Units. The requirements of this section do not apply to electric utility steam generating units unless and until such time as these units are added to the source category list pursuant to section 112(c)(5) of the Act.

(d) Exclusion for Stationary Sources in Deleted Source Categories. The requirements of this section do not apply to stationary sources that are within a source category that has been deleted from the source category list pursuant to section 112(c)(9) of the Act.

(e) Exclusion for Research and Development Activities. The requirements of this section do not apply to research and development activities, as defined in Chapter 6, Section 6(f)(xiii).

(f) Definitions:

Terms used in this section that are not defined in this section have the meaning given to them in the Act and in Chapter 5, Section 3.

(i) ***“Affected source”*** means the stationary source or group of stationary sources which, when fabricated (on site), erected, or installed meets the definition of “construct a major source” or the definition of “reconstruct a major source” contained in this section.

(ii) ***“Affected States”*** are all States:

(A) Whose air quality may be affected and that are contiguous to the State of Wyoming where a MACT determination is made in accordance with this Section; or

(B) Whose air quality may be affected and that are within 50 miles of the major source for which a MACT determination is made in accordance with this section.

(iii) **“Available information”** means, for purposes of identifying control technology options for the affected source, information contained in the following information sources as of the date of approval of the MACT determination by the Division:

(A) A relevant proposed regulation, including all supporting information;

(B) Background information documents for a draft or proposed regulation;

(C) Data and information available for the EPA Control Technology Center developed pursuant to section 113 of the Act;

(D) Data and information contained in the EPA Aerometric Informational Retrieval System including information in the MACT data base;

(E) Any additional information that can be expeditiously provided by EPA; and

(F) For the purpose of determinations by the Division, any additional information provided by the applicant or others, and any additional information considered available by the Division.

(iv) **“Construct a major source”** means:

(A) To Fabricate, erect, or install at any greenfield site a stationary source or group of stationary sources which is located within a contiguous area and under common control and which emits or has the potential to emit 10 tons per year of any HAPs or 25 tons per year of any combination of HAP, or

(B) To fabricate, erect, or install at any developed site a new process or production unit which in and of itself emits or has the potential to emit 10 tons per year of any HAP or 25 tons per year of any combination of HAP, unless the process or production unit satisfies criteria in paragraphs (B)(I) through (VI) of this definition.

(I) All HAP emitted by the process or production unit that would otherwise be controlled under the requirements of this section will be controlled by emission control equipment which was previously installed at the same site as the process or production unit;

(II) (1.) The Division has determined within a period of 5 years prior to the fabrication, erection, or installation of the process or production unit that the existing emission control equipment represented best available control technology (BACT), toxics-best available control technology (T-BACT), under Chapter 6, Section 2, or MACT based on State air toxic rules for the category of pollutants which includes those HAPs to be emitted by the process or production unit; or

(2.) The Division determines that the control of HAP emissions provided by the existing equipment will be equivalent to that level of control currently achieved by other well-controlled similar sources (i.e., equivalent to the level of control that would be provided by a current BACT, T-BACT, or State air toxic rule MACT determination);

(III) The Division determines that the percent control efficiency for emissions of HAP from all sources to be controlled by the existing control equipment will be equivalent to the percent control efficiency provided by the control equipment prior to the inclusion of the new process or production unit;

(IV) The Division has provided notice and an opportunity for public comment concerning its determination that criteria in paragraphs (B)(I), (B)(II), and (B)(III) of this definition apply and concerning the continued adequacy of any prior BACT, T-BACT, or State air toxic rule MACT determination;

(V) If any commenter has asserted that a prior BACT, T-BACT, or State air toxic rule MACT determination is no longer adequate, the Division has determined that the level of control required by that prior determination remains adequate; and

(VI) Any emission limitations, work practice requirements, or other terms and conditions upon which the above determinations by the Division are applicable requirements under Chapter 6, Section 3 and either have been incorporated into any existing operating permit for the affected facility or will be incorporated into such permit upon issuance.

(v) ***“Control technology”*** means measures, processes, methods, systems, or techniques to limit the emission of hazardous air pollutants through process changes, substitution of materials or other modifications;

(A) Reduce the quantity of, or eliminate emissions of, such pollutants through process changes, substitution of materials or other modifications;

(B) Enclose systems or processes to eliminate emissions;

(C) Collect, capture or treat such pollutants when released from a process, stack, storage or fugitive emissions point;

(D) Are design, equipment, work practice, or operational standards (including requirements for operator training or certification) as provided in 42 U.S.C. 7412(h); or

(E) Are a combination of paragraphs (A) through (D) of this definition.

(vi) ***“Electric utility steam generating unit”*** means any fossil fuel fired combustion unit of more than 25 megawatts that serves a generator that produces electricity for sale. A unit that co-generates steam and electricity and supplies more than one-third of its potential electric output capacity and more than 25 megawatts electric output to any utility power distribution system for sale shall be considered an electric utility steam generating unit.

(vii) ***“Greenfield site”*** means a contiguous area under common control that is an undeveloped site.

(viii) ***“List of Source Categories”*** means the Source Category List required by section 112(c) of the Act.

(ix) ***“Maximum achievable control technology (MACT) emission limitation for new sources”*** means the emission limitation which is not less stringent than the emission limitation achieved in practice by the best controlled similar source, and which reflects the maximum degree of reduction in emissions that the Division, taking into consideration the cost of achieving such emission reduction, and any non-air quality health and environmental impacts and energy requirements, determines is achievable by the constructed or reconstructed major source.

(x) ***“Notice of MACT Approval”*** means a Chapter 6, Section 2 permit issued by a Division containing all federally enforceable conditions necessary to enforce the application and operation of MACT or other control technologies such that the MACT emission limitation is met.

(xi) ***“Process or production unit”*** means any collection of structures and/or equipment, that processes, assembles, applies, or otherwise uses material inputs to

produce or store an intermediate or final product. A single facility may contain more than one process or production unit.

(xii) ***“Reconstruct a major source”*** means the replacement of components at an existing process or production unit that in and of itself emits or has the potential to emit 10 tons per year of any HAP or 25 tons per year of any combination of HAP, whenever:

(A) The fixed capital cost of the new components exceeds 50 percent of the fixed capital cost that would be required to construct a comparable process or production unit; and

(B) It is technically and economically feasible for the reconstructed major source to meet the applicable maximum achievable control technology emission limitation for new sources established under this section.

(xiii) ***“Research and development activities”*** means activities conducted at a research or laboratory facility whose primary purpose is to conduct research and development into new processes and products, where such source is operated under the close supervision of technically trained personnel and is not engaged in the manufacture of products for sale or exchange for commercial profit, except in a de minimis manner.

(xiv) ***“Similar source”*** means a stationary source or process that has comparable emissions and is structurally similar in design and capacity to a constructed or reconstructed major source such that the source could be controlled using the same control technology.

(g) Prohibition. After the effective date of this section no person may begin actual construction or reconstruction of a major source of HAP unless:

(i) The major source in question has been specifically regulated or exempted from regulation under a standard issued pursuant to section 112(d), section 112(h) or section 112(j) in 40 CFR part 63, and the owner and operator has fully complied with all procedures and requirements for preconstruction review established by that standard, including any applicable requirements set forth in Chapter 6, Section 5; or

(ii) The Division has made a final and effective case-by-case determination pursuant to the provisions of Chapter 6, Section 6(h) such that emissions from the constructed or reconstructed major source will be controlled to a level no less stringent than the maximum achievable control technology emission limitation for new sources.

(h) Maximum Achievable Control Technology (MACT) Determinations for Constructed and Reconstructed Major Sources.

(i) Applicability. The requirements of this section apply to an owner or operator who constructs or reconstructs a major source of HAP subject to a case-by-case determination of maximum achievable control technology pursuant to Chapter 6, Section 6(g).

(ii) Requirements for Constructed and Reconstructed Major Sources. When a case-by-case determination of MACT is required by Chapter 6, Section 6(g), the owner and operator shall obtain from the Division an approved MACT determination in conjunction with the required Chapter 6, Section 2 permit according to the requirements listed in Chapter 6, Section 6(h)(iv).

(iii) Principles of MACT Determinations. The following general principles shall govern preparation by the owner or operator of each permit application or other application requiring a case-by-case MACT determination concerning construction or reconstruction of a major source, and all subsequent review of and actions taken concerning such an application by the Division:

(A) The MACT emission limitation or MACT requirements recommended by the applicant and approved by the Division shall not be less stringent than the emission control which is achieved in practice by the best controlled similar source, as determined by the Division.

(B) Based upon available information, as defined in this section, the MACT emission limitation and control technology (including any requirements under Chapter 6, Section 6(h)(iii)(C)) recommended by the applicant and approved by the Division shall achieve the maximum degree of reduction in emissions of HAP which can be achieved by utilizing those control technologies that can be identified from the available information, taking into consideration the costs of achieving such emission reduction and any non-air quality health and environmental impacts and energy requirements associated with the emission reduction.

(C) The applicant may recommend a specific design, equipment, work practice, or operational standard, or a combination thereof, and the Division may approve such a standard if the Division specifically determines that it is not feasible to prescribe or enforce an emission limitation under the criteria set forth in section 112(h)(2) of the Act.

(D) If EPA has either proposed a relevant emission standard pursuant to section 112(d) or section 112(h) of the Act or adopted a presumptive MACT determination for the source category which includes the constructed or reconstructed major source, then the MACT requirements applied to the constructed or reconstructed major source shall have considered those MACT emission limitations and requirements of the proposed standard or presumptive MACT determination.

(iv) Application Requirements for a Case-By-Case MACT Determination.

(A) An application for a MACT determination, in conjunction with an application for a permit pursuant to Chapter 6, Section 2, shall specify a control technology selected by the owner or operator that, if properly operated and maintained, will meet the MACT emission limitation or standard as determined according to the principles set forth in Chapter 6, Section 6(h)(iii).

(B) In each instance where a constructed or reconstructed major source would require additional control technology or a change in control technology, the application for a MACT determination shall contain the following information:

(I) The name and address (physical location) of the major source to be constructed or reconstructed;

(II) A brief description of the major source to be constructed or reconstructed and identification of any listed source category or categories in which it is included;

(III) The expected commencement date for the construction or reconstruction of the major source;

(IV) The expected completion date for construction or reconstruction of the major source;

(V) The anticipated date of start-up for the constructed or reconstructed major source;

(VI) The HAP emitted by the constructed or reconstructed major source, and the estimated emission rate for each such HAP, to the extent this information is needed by the Division to determine MACT;

(VII) Any federally enforceable emission limitations applicable to the constructed or reconstructed major source;

(VIII) The maximum and expected utilization of capacity of the constructed or reconstructed major source, and the associated uncontrolled emission rates for that source, to the extent this information is needed by the Division to determine MACT;

(IX) The controlled emissions for the constructed or reconstructed major source in tons/yr at expected and maximum utilization of capacity, to the extent this information is needed by the Division to determine MACT;

(X) A recommended emission limitation for the constructed or reconstructed major source consistent with the principles set forth in paragraph (iii) of this section;

(XI) The selected control technology to meet the recommended MACT emission limitation, including technical information on the design, operation, size, estimated control efficiency of the control technology (and the manufacturer's name, address, telephone number, and relevant specifications and drawings, if requested by the Division);

(XII) Supporting documentation including identification of alternative control technologies considered by the applicant to meet the emission limitation, and analysis of cost and non-air quality health environmental impacts or energy requirements for the selected control technology; and

(XIII) Any other relevant information required pursuant to Section 33.

(C) In each instance where the owner or operator contends that a constructed or reconstructed major source will be in compliance, upon startup, with case-by-case MACT under this section without a change in control technology, the application for a MACT determination shall contain the following information:

(I) The information described in Chapter 6, Section 6(h)(iv)(B)(I) through (iv)(B)(X); and

(II) Documentation of the control technology in place.

(v) Administrative Procedures for Review of the Notice of MACT Approval.

(A) The administrative procedures for review shall follow the procedures specified in Chapter 6, Section 2(g) for the permit review and approval or denial process.

(vi) Notice of MACT Approval.

(A) The Notice of MACT Approval will contain a MACT emission limitation (or a MACT work practice standard if the Division determines it is not feasible to prescribe or enforce an emission standard) to control the emissions of HAP. The MACT emission limitation or standard will be determined by the Division and will conform to the principles set forth in Chapter 6, Section 6(h)(iii) of this section.

(B) The Notice of MACT Approval will specify any notification, operation and maintenance, performance testing, monitoring, reporting and recordkeeping requirements. The Notice of MACT Approval shall include:

(I) In addition to the MACT emission limitation or MACT work practice standard established under this section, additional emission limits, production limits, operational limits or other terms and conditions necessary to ensure Federal enforceability of the MACT emission limitation;

(II) Compliance certifications, testing, monitoring, reporting and recordkeeping requirements that are consistent with the requirements of Chapter 6, Section 3(h);

(III) In accordance with section 114(a)(3) of the Act, monitoring shall be capable of demonstrating continuous compliance during the applicable reporting period. Such monitoring data shall be of sufficient quality to be used as a basis for enforcing all applicable requirements established under this section, including emission limitations;

(IV) A statement requiring the owner or operator to comply with all applicable requirements contained in Chapter 5, Section 3 and Chapter 6, Section 5;

(C) All provisions contained in the Notice of MACT Approval shall be federally enforceable upon the effective date of issuance of such notice, as provided by Chapter 6, Section 6(h)(ix).

(D) The Notice of MACT Approval shall expire if construction or reconstruction has not commenced within 18 months of issuance, unless the Division has granted an extension which shall not exceed an additional 12 months.

(vii) Opportunity for Public Comment on the Notice of MACT Approval.

(A) The opportunity for public comment shall follow the procedures specified in Chapter 6, Section 2(m) for the permit review and approval process.

(viii) EPA Notification. The Division shall send a copy of the final Notice of MACT Approval issued pursuant to Chapter 6, Section 2 and this section to the EPA through the appropriate Regional Office, and to all other State and local air pollution control agencies having jurisdiction in affected States.

(ix) Effective Date. The effective date of a MACT determination shall be the date of issuance of the Chapter 6, Section 2 permit to construct or reconstruct.

(x) Compliance Date. On and after the date of start-up, a constructed or reconstructed major source which is subject to the requirements of this section shall be in compliance with all applicable requirements specified in the MACT determination.

(xi) Compliance With MACT Determinations.

(A) An owner or operator of a constructed or reconstructed major source that is subject to a MACT determination shall comply with all requirements in the final Notice of MACT Approval, including but not limited to any MACT emission limitation or MACT work practice standard, and any notification, operation and maintenance, performance testing, monitoring, reporting, and recordkeeping requirements.

(B) An owner or operator of a constructed or reconstructed major source which has obtained a MACT determination shall be deemed to be in compliance with Chapter 6, Section 6(g) only to the extent that the constructed or reconstructed major source is in compliance with all requirements set forth in the final Notice of MACT Approval issued pursuant to Chapter 6, Section 2 and this section. Any violation of such requirements by the owner or operator shall be deemed by the Division and by EPA to be a violation of the prohibition on construction or reconstruction in Chapter 6, Section 6(g) for whatever period the owner or operator is determined to be in violation of such requirements, and shall subject the owner or operator to appropriate enforcement action.

(xii) Reporting to EPA. Within 60 days of the issuance of a final Notice of MACT Approval issued pursuant to Chapter 6, Section 2 and this section, the Division shall provide a copy of such notice to the Administrator, and shall provide a summary in a compatible electronic format for inclusion in the MACT data base.

(i) Requirements for Constructed or Reconstructed Major Sources Subject to a Subsequently Promulgated MACT Standard or MACT Requirement.

(i) If EPA promulgates an emission standard under section 112(d) or section 112(h) of the Act or the Division issues a determination under section 112(j) of the Act that is applicable to a stationary source or group of sources which would be deemed to be a constructed or reconstructed major source under this section before the date that the owner or operator has obtained a final and legally effective MACT determination pursuant to Chapter 6, Section 6(h), the owner or operator of the source(s) shall comply with the promulgated standard or determination rather than any MACT determination under this section by the Division, and the owner or operator shall comply with the promulgated standard by the compliance date in the promulgated standard.

(ii) If EPA promulgates an emission standard under section 112(d) or section 112(h) of the Act or the Division makes a determination under section 112(j) of the Act that is applicable to a stationary source or group of sources which was deemed to

be a constructed or reconstructed major source under this section and has been subject to a prior case-by-case MACT determination pursuant to Chapter 6, Section 6(h), and the owner and operator obtained a final and legally effective case-by-case MACT determination prior to the promulgation date of such emission standard, then the Division shall (if the initial operating permit has not yet been issued) issue an initial operating permit which incorporates the emission standard or determination, or shall (if the initial operating permit has been issued) revise the operating permit according to the reopening procedures in Chapter 6, Section 3(d)(vii) to incorporate the emission standard or determination.

(A) The EPA may include in the emission standard established under section 112(d) or section 112(h) of the Act a specific compliance date for those sources which have obtained a final and legally effective MACT determination under this section and which have submitted the information required by Chapter 6, Section 6(h) to the EPA before the close of the public comment period for the standard established under section 112(d) of the Act. Such date shall assure that the owner or operator shall comply with the promulgated standard as expeditiously as practicable, but not longer than 8 years after such standard is promulgated. In that event, the Division shall incorporate the applicable compliance date in the Chapter 6, Section 3 operating permit.

(B) If no compliance date has been established in the promulgated 112(d) or 112(h) standard or section 112(j) determination, for those sources which have obtained a final and legally effective MACT determination under this section, then the Division shall establish a compliance date in the Chapter 6, Section 3 operating permit that assures that the owner or operator shall comply with the promulgated standard or determination as expeditiously as practicable, but not longer than 8 years after such standard is promulgated or a section 112(j) determination is made.

(iii) Notwithstanding the requirements of paragraphs (i) and (ii) of this section, if EPA promulgates an emission standard under section 112(d) or section 112(h) of the Act or the Division issues a determination under section 112(j) of the Act that is applicable to a stationary source or group of sources which was deemed to be a constructed or reconstructed major source under this section and which is the subject of a prior case-by-case MACT determination pursuant to subsection (h), and the level of control required by the emission standard issued under section 112(d) or section 112(h) or the determination issued under section 112(j) is less stringent than the level of control required by any emission limitation or standard in the prior MACT determination, the Division is not required to incorporate any less stringent terms of the promulgated standard in the Chapter 6, Section 3 operating permit applicable to such source(s) and may in its discretion consider any more stringent provisions of the prior MACT determination to be applicable legal requirements when issuing or revising such an operating permit.

Section 7. **Clean air resource allocation expiration.**

(a) (i) Any owner or operator of a facility which ceases operation shall not be entitled to the continued use of the clean air resource necessary to accommodate the emissions from such facility if such cessation of operation extends beyond a day 5 years after the date of cessation of such operation.

(ii) Within 60 days after determining that a facility has ceased operation, the Administrator shall notify in writing the affected owner or operator that this section is applicable. The notice shall further advise the owner or operator of the proposed expiration date for the facility's entitlement to use its allocated air resource and provide the operator or owner the opportunity to review the Administrator's decision.

Within 60 days after receiving the notice, the owner or operator of the facility shall notify the Administrator if it intends to operate the facility in the future. Failure to so notify the Administrator will constitute a rebuttable presumption that the owner or operator has permanently and purposefully ceased operation of the facility with no intent to operate in the future. The continuous five-year period shall not begin earlier than 60 days prior to receipt by the owner or operator of the notice from the Administrator.

(iii) Prior to revoking an air allocation, the Administrator shall provide notice to the affected owner or operator and if requested by the owner or operator will hold a public hearing pursuant to Chapter III of the Rules of Practice and Procedure of the Department on the impending expiration of the entitlement to use the allocated clean air resource. Said notice shall be served no later than six months prior to the proposed expiration date. The Administrator's decision issued as a result of the Chapter III hearing may be appealed to the Environmental Quality Council in the manner set forth in the Environmental Quality Act and the applicable rules and regulations.

(iv) The Administrator may extend the 5-year time period for non-use upon a satisfactory showing that the owner or operator intends and can demonstrate firm plans to operate the facility in the future.

(v) The transfer of ownership of a facility shall not affect the entitlement for use by the facility of the clean air resource. Such a transfer of ownership does not extend the expiration date defined in paragraph (a)(i).

(vi) For purposes of this section "operation" means to function in a manner which directly contributes to the accomplishment of the primary purpose of the facility. The definition of operation of a mining facility shall include: (i) all of the primary activities associated with mining, such as ore and overburden removal, topsoil stripping and haulage, reclamation and associated construction activities, and (ii) activities and commitments accepted by the Department as "interim stabilization" measures which qualify the mine for "temporary cessation and a resultant extension of

reclamation obligations” under the regulations of the Land Quality Division of the Department.

(b) (i) In a case where an owner or operator permanently and purposefully ceases operation with no expressed intent to operate the facility in the future, the associated clean air resource allocation is not reserved to the owner or operator and immediately reverts to the state.

(ii) Prior to such revocation the Administrator shall provide notice to the affected owner or operator and if requested by such owner or operator will hold a public hearing pursuant to Chapter III of the Rules of Practice and Procedure of the Department.

(c) Start-up and operation of a facility after a period of non-use which lasts at least 5 years shall be considered to represent the operation of a new facility and shall be subject to the permit requirements of Chapter 6, Section 2. The provisions of Chapter 6, Section 4 may also be applicable.

(d) Brief periods of facility operation which are clearly designed to circumvent the intent of this section shall not be considered as operation under the provisions of subsections (a) and (b) above. For purposes of this section, operation must be for commercial purposes (which does not include temporary operation for period testing or maintenance of the facility in a standby status).

Section 8. **[Reserved.]**

Section 9. **Best available retrofit technology (BART).**

(a) Applicability. The provisions of this regulation apply to existing stationary facilities, as defined in Section 9(b) of this chapter.

(b) Definitions.

“Adverse impact on visibility” means visibility impairment which interferes with the management, protection, preservation, or enjoyment of the visitor’s visual experience of the Federal Class I area. This determination must be made on a case-by-case basis taking into account the geographic extent, intensity, duration, frequency and time of visibility impairments, and how these factors correlate with 1) times of visitor use of the Federal Class I area, and 2) the frequency and timing of natural conditions that reduce visibility. This term does not include effects on integral vistas.

“Applicable technology” means a commercially available control option that has been or is soon to be deployed (e.g., is specified in a permit) on the same or a similar source type or a technology that has been used on a pollutant-bearing gas stream that is the same or similar to the gas stream characteristics of the source.

“Available technology” means that a technology is licensed and available through commercial sales.

“Average cost effectiveness” means the total annualized costs of control divided by annual emissions reductions (the difference between baseline annual emissions and the estimate of emissions after controls). For the purposes of calculating average cost effectiveness, baseline annual emissions means a realistic depiction of anticipated annual emissions for the source. The source or the Division may use State or Federally enforceable permit limits or estimate the anticipated annual emissions based upon actual emissions from a representative baseline period.

“BART alternative” means an alternative measure to the installation, operation, and maintenance of BART that will achieve greater reasonable progress toward national visibility goals than would have resulted from the installation, operation, and maintenance of BART at BART-eligible sources within industry source categories subject to BART requirements.

“Best available retrofit technology (BART)” means an emission limitation based on the degree of reduction achievable through the application of the best system of continuous emission reduction for each pollutant that is emitted by an existing stationary facility. The emission limitation must be established, on a case-by-case basis, taking into consideration the technology available, the costs of compliance, the energy and non air quality environmental impacts of compliance, any pollution control equipment in use or in existence at the source or unit, the remaining useful life of the source or unit, and the degree of improvement in visibility which may reasonably be anticipated to result from the use of such technology.

“Deciview” means a measurement of visibility impairment. A deciview is a haze index derived from calculated light extinction, such that uniform changes in haziness correspond to uniform incremental changes in perception across the entire range of conditions, from pristine to highly impaired. The deciview haze index is calculated based on the following equation (for the purposes of calculating deciview, the atmospheric light extinction coefficient must be calculated from aerosol measurements):

$$\text{Deciview haze index} = 10 \ln_e (b_{\text{ext}}/10 \text{ Mm}^{-1})$$

Where b_{ext} = the atmospheric light extinction coefficient, expressed in inverse megameters (Mm^{-1}).

“Existing stationary facility” means any of the following stationary sources of air pollutants, including any reconstructed source, which was not in operation prior to August 7, 1962, and was in existence on August 7, 1977, and has the potential to emit 250 tons per year or more of any visibility impairing air pollutant. In determining potential to emit, fugitive emissions, to the extent quantifiable, must be counted.

(i) Fossil fuel-fired steam electric plants of more than 250 million British thermal units (BTU) per hour heat input that generate electricity for sale.

(A) Boiler capacities shall be aggregated to determine the heat input of a plant.

(B) Includes plants that co-generate steam and electricity and combined cycle turbines.

(ii) Coal cleaning plants (thermal dryers).

(iii) Kraft pulp mills.

(iv) Portland cement plants.

(v) Primary zinc smelters.

(vi) Iron and steel mill plants.

(vii) Primary aluminum ore reduction plants.

(viii) Primary copper smelters.

(ix) Municipal incinerators capable of charging more than 250 tons of refuse per day.

(x) Hydrofluoric, sulfuric, and nitric acid plants.

(xi) Petroleum refineries.

(xii) Lime plants.

(xiii) Phosphate rock processing plants. Includes all types of phosphate rock processing facilities, including elemental phosphorous plants as well as fertilizer production plants.

(xiv) Coke oven batteries.

(xv) Sulfur recovery plants.

(xvi) Carbon black plants (furnace process).

(xvii) Primary lead smelters.

(xviii) Fuel conversion plants.

(xix) Sintering plants.

(xx) Secondary metal production facilities. Includes nonferrous metal facilities included within Standard Industrial Classification code 3341, and secondary ferrous metal facilities in the category “iron and steel mill plants”.

(xxi) Chemical process plants. Includes those facilities within the 2-digit Standard Industrial Classification 28, including pharmaceutical manufacturing facilities.

(xxii) Fossil fuel boilers of more than 250 million BTUs per hour heat input.

(A) Individual boilers greater than 250 million BTU/hr, considering federally enforceable operational limits.

(B) Includes multi-fuel boilers that burn at least fifty percent fossil fuels.

(xxiii) Petroleum storage and transfer facilities with a capacity exceeding 300,000 barrels.

(A) 300,000 barrels refers to total facility-wide tank capacity for tanks put in place after August 7, 1962 and in existence on August 7, 1977.

(B) Includes gasoline and other petroleum-derived liquids.

(xxiv) Taconite ore processing facilities.

(xxv) Glass fiber processing plants.

(xxvi) Charcoal production facilities. Includes charcoal briquette manufacturing and activated carbon production.

“Incremental cost effectiveness” means the comparison of the costs and emissions performance level of a control option to those of the next most stringent option, as shown in the following formula:

$$\text{Incremental Cost Effectiveness (dollars per incremental ton removed)} = \frac{[(\text{Total annualized costs of control option}) - (\text{Total annualized costs of next control option})] \div [(\text{Next control option annual emissions}) - (\text{Control option annual emissions})]}{}$$

“In existence” means that the owner or operator has obtained all necessary preconstruction approvals or permits required by Federal, State, or local air pollution emissions and air quality laws or regulations and either has 1) begun, or caused to begin, a continuous program of physical on-site construction of the facility or 2) entered into binding agreements or contractual obligations, which cannot be cancelled or modified without substantial loss to the owner or operator, to undertake a program of construction of the facility to be completed in a reasonable time.

“In operation” means engaged in activity related to the primary design function of the source.

“Integral vista” means a view perceived from within the mandatory Class I Federal area of a specific landmark or panorama located outside the boundary of the mandatory Class I Federal area.

“Natural conditions” means naturally occurring phenomena that reduce visibility as measured in terms of light extinction, visual range, contrast, or coloration.

“Plant” means all emissions units at a stationary source.

“Potential to emit” means the maximum capacity of a stationary source to emit a pollutant under its physical and operational design. Any physical or operational limitation on the capacity of the source to emit a pollutant including air pollution control equipment and restrictions on hours of operation or on the type or amount of material combusted, stored, or processed, shall be treated as part of its design if the limitation or the effect it would have on emissions is federally enforceable. Secondary emissions do not count in determining the potential to emit of a stationary source.

“Visibility-impairing air pollutant” includes the following:

(i) Sulfur dioxide (SO₂);

(ii) Nitrogen oxides (NO_x); and

(iii) Particulate matter. (PM₁₀ will be used as the indicator for particulate matter. Emissions of PM₁₀ include the components of PM_{2.5} as a subset).

(c) Guidelines for BART Determinations.

(i) The U.S. Environmental Protection Agency regulations contained in 40 CFR part 51, Appendix Y, are incorporated by reference into these regulations. The specific documents containing the complete text of the regulations are found in 40 CFR part 51, Appendix Y, as published on July 6, 2005 in the Federal Register beginning on page 39104, not including later amendments. Copies of the July 6, 2005 materials can be

obtained from the Department of Environmental Quality, Division of Air Quality, 122 W. 25th Street, Cheyenne, Wyoming 82002.

(ii) The owner or operator of a fossil fuel-fired steam electric plant with a generating capacity greater than seven hundred fifty megawatts of electricity shall comply with the requirements of 40 CFR part 51, Appendix Y. All other facility owners or operators shall use Appendix Y as guidance for preparing their best available control retrofit technology determinations.

(d) Identification of Sources Subject to BART.

(i) Identification of sources subject to BART shall be performed by the Air Quality Division in accordance with EPA's guidelines for BART determinations under the regional haze rule 40 CFR part 51, Appendix Y, and incorporated by reference under Section 9(c). A BART-eligible source is subject to BART unless valid air quality dispersion modeling demonstrates that the source will not cause or contribute to visibility impairment in any Class I area.

(A) A single source that is responsible for a 1.0 deciview change or more is considered to "cause" visibility impairment in any Class I area.

(B) A single source that is responsible for a 0.5 deciview change or more is considered to "contribute" visibility impairment in any Class I area.

(C) A single source is exempt from BART if the 98th percentile daily change in visibility, as compared against natural background conditions, is less than 0.5 deciviews at all Class I federal areas for each year modeled and for the entire multi-year modeling period.

(ii) The Division will provide written notice to each source determined to be subject to BART.

(e) BART Requirements.

(i) Submission of Best Available Retrofit Technology (BART) Permit Application. The owner or operator of each source subject to BART as determined under Section 9(d), shall submit a BART permit application to the Division. The permit application shall be submitted according to a schedule determined by the Division. Sources with a potential to emit less than 40 tons per year SO₂ or NO_x or less than 15 tons per year PM₁₀ may exclude those de minimis level pollutants from the BART analysis. The BART permit application shall include:

(A) The name and address (physical location) of the existing stationary facility subject to BART.

(B) A brief description of the source and identification of any listed source categories in which it is included.

(C) Information on de minimis levels if pollutants are excluded from the analysis.

(D) An analysis of control options performed in accordance with 40 CFR part 51, Appendix Y, IV.

(E) A proposal and justification for BART emission limits and control technology that reflect the BART requirements established in 40 CFR part 51, Appendix Y.

(F) A description of the proposed emission control systems, including the estimated control efficiencies.

(G) A schedule to install and operate BART.

(H) Additional relevant information as the Administrator may request.

(ii) Administrative Procedures for Review of a BART Permit Application. The administrative procedures for review shall follow the procedures specified in Chapter 6, Section 2(g) of these regulations.

(iii) Proposed Permits. The Administrator shall prepare a proposed permit following the Division's review of the BART permit application. The Administrator may approve, or amend the proposed emission limits, BART technology, and compliance schedule. Any proposed permit shall specify any notification, operation and maintenance, performance testing, monitoring, reporting and recordkeeping requirements determined by the Administrator to be reasonable and necessary.

(iv) Opportunity for Public Comment. The opportunity for public comment shall follow the procedures specified in Chapter 6, Section 2(m) for permit review.

(v) Modifications to BART Permits. Any source seeking to modify the BART determination for that facility must obtain the Administrator's approval.

(vi) Operating Permit Requirements. BART requirements established pursuant to any BART permit issued under this section shall be included in a Chapter 6, Section 3 Operating Permit according to the procedures established in Chapter 6, Section 3.

(vii) Fees. Persons applying for a permit under this section shall pay a fee to cover the Department's cost of reviewing and acting on permit applications in accordance with Chapter 6, Section 2(o).

(viii) Installation of Best Available Retrofit Technology. The owner or operator of any source required to operate under a BART permit issued under Section 9(e)(iii), shall install and operate best available retrofit technology unless an alternative to the installation of BART as specified under Section 9(f) has been approved by the Division. Any control equipment required under a permit issued in this section shall be installed and operating as expeditiously as practicable but in no event later than five years after the United States Environmental Protection Agency's approval of Wyoming's State Implementation Plan revision for Regional Haze.

(ix) Operation and Maintenance of Best Available Retrofit Technology. The owner or operator of a facility required to install best available retrofit technology under Section 9(e)(viii) shall establish procedures to ensure such equipment is properly operated and maintained.

(f) BART Alternative.

(i) The Administrator may implement or require participation in an emissions trading program or other alternative measures developed in accordance with 40 CFR 51.308(e) rather than to require sources subject to BART to install, operate and maintain BART.

(g) Monitoring, Recordkeeping and Reporting. The owner or operator of any existing stationary facility that is required to install best available retrofit technology or an approved BART alternative shall conduct monitoring, recordkeeping and reporting sufficient to show compliance or noncompliance on a continuous basis.

Section 10. **[Reserved.]**

Section 11. **[Reserved.]**

Section 12. **[Reserved.]**

Section 13. **Nonattainment permit requirements.**

(a) 40 CFR part 51.165 is herein incorporated by reference, in its entirety, with the exception of paragraph (a) and paragraph (a)(1).

Section 14. Incorporation by reference.

(a) Code of Federal Regulations (CFR). All Code of Federal Regulations (CFRs) cited in this chapter, including their Appendices, revised and published as of July 1, 2008, not including any later amendments, are incorporated by reference. Copies of the Code of Federal Regulations are available for public inspection and copies can be obtained at cost from the Department of Environmental Quality, Division of Air Quality, 122 W. 25th Street, Cheyenne, Wyoming 82002. Copies of the CFRs can also be obtained at cost from Government Institutes, 15200 NBN Way, Building B, Blue Ridge Summit, PA 17214.

**WYOMING DEPARTMENT OF ENVIRONMENTAL QUALITY
AIR QUALITY DIVISION
STANDARDS AND REGULATIONS**

Permitting Requirements

CHAPTER 6

Section 1. Introduction to permitting requirements.

(a) Chapter 6 establishes permitting requirements for all sources constructing and/or operating in the State of Wyoming. Section 2 covers general air quality permitting requirements for construction and modification as well as minor source permits to operate. Section 3 is the state operating permit program required under Title V of the Clean Air Act. Section 4 is the prevention of significant deterioration (PSD) program. Section 5 covers permitting requirements for major sources of hazardous air pollutants for which a MACT (maximum achievable control technology) standard has been established under section 112 of the Clean Air Act. Section 6 covers permitting requirements for major sources of hazardous air pollutants for which a MACT standard has not been established under section 112 of the Clean Air Act. Section 7 establishes the terms under which clean air resource allocations expire. Section 8 is reserved. Section 9 establishes Best Available Retrofit Technology (BART) requirements and provides guidelines for identifying sources subject to BART. Sections 10, 11 and 12 are reserved. Section 13 incorporates by reference 40 CFR part 51.165, nonattainment permit requirements. Section 14 incorporates by reference all Code of Federal Regulations (CFRs) cited in this chapter, including their Appendices.

Section 2. Permit requirements for construction, modification, and operation.

(a) (i) Any person who plans to construct any new facility or source, modify any existing facility or source, or to engage in the use of which may cause the issuance of or an increase in the issuance of air contaminants into the air of this state shall obtain a construction permit from the State of Wyoming, Department of Environmental Quality before any actual work is begun on the facility.

(ii) Any facility or source required to obtain a permit for construction or modification under this section must, if subject to the provisions of Chapter 6, Section 3 of these regulations, submit an application to the Division for a Chapter 6, Section 3 operating permit within twelve (12) months of commencing operation.

(iii) Facilities or sources not subject to the provisions of Chapter 6, Section 3 of these regulations shall obtain a Chapter 6, Section 2 operating permit from the Department, pursuant to this section, for operation after a 120-day start-up period.

(iv) A permit to operate is also required for the operation of an existing portable source in each new location. However, a permit to construct is required for each new location that is a new source or facility and for each new or modified portable source or facility.

(v) Permit Fees: Persons applying for a permit under this section, or waiver from permit requirements under Chapter 6, Section 2(k)(viii), shall pay a fee to cover the Department's cost of reviewing and acting on permit applications in accordance with paragraph (o) of this section.

(vi) Facilities or sources subject to the provisions of Chapter 6, Section 5 or Chapter 6, Section 6 shall submit the permit application as required by Chapter 6, Section 5(a)(iii) or by Chapter 6, Section 6(h)(iv) as part of the permit application submitted in accordance with Chapter 6, Section 2(b)(i).

(b) (i) The owner of the facility or the operator of the facility authorized to act for the owner is responsible for applying for and obtaining a permit to construct and/or operate. The application shall be made on forms provided by the Division of Air Quality and each application shall be accompanied by site information, plans descriptions, specifications, and drawings showing the design of the source, the nature and amount of the emissions, and the manner in which it will be operated and controlled. A detailed schedule for the construction or modification of the facility shall be included. A separate application is required for each source. Any additional information, plans, specifications, evidence, or documentation that the Administrator of the Division of Air Quality may require shall be furnished upon request. The applicant shall conduct such continuous Ambient Air Quality monitoring analyses as may be determined by the Administrator to be necessary in order to assure that adequate data are available for purposes of establishing existing concentration levels of all affected pollutants. As a guideline, such data should be gathered continuously over a period of one calendar year preceding the date of application. Upon petition of the applicant, the Administrator will review the proposed monitoring programs and advise the applicant if such is approvable or modifications are required.

(ii) For portable sources or facilities, the Division may authorize the owner or operator to utilize a "self issuance" operating permit system for new locations which are not new sources or facilities. For purposes of this paragraph, a new source or facility is a source or facility for which operation or construction commenced after May 29, 1974, and for which a permit has not previously been issued.

The Division shall provide to authorized owners or operators of portable sources, forms upon which the self-issued permits are to be recorded. The owner or operator shall, at a minimum provide, as appropriate the permit number previously issued to the portable source or facility, the new location for which the permit is issued, the duration of

operation of the new location, the production rate at the new location and the production at the new location in addition to any other information that the Administrator may require. Such permit shall be executed and a copy provided to the Air Quality Division prior to operation at the new location.

All conditions previously issued for the operation of the portable facility continue as applicable conditions for operation at subsequent locations.

(c) No approval to construct or modify shall be granted unless the applicant shows, to the satisfaction of the Administrator of the Division of Air Quality that:

(i) The proposed facility will comply with all rules and regulations of the Wyoming Department of Environmental Quality, Division of Air Quality, and with the intent of the Wyoming Environmental Quality Act.

(ii) The proposed facility will not prevent the attainment or maintenance of any ambient air quality standard.

(A) A facility will be considered to cause or contribute to a violation of an ambient air quality standard if the projected impact of emissions from the facility exceed the following significance levels at any locality that does not or would not meet the applicable standard:

POLLUTANT	AVERAGING TIME (HOURS)				
	ANNUAL ($\mu\text{g}/\text{m}^3$)	24 ($\mu\text{g}/\text{m}^3$)	8 (mg/m^3)	3 ($\mu\text{g}/\text{m}^3$)	1 (mg/m^3)
SO ₂	1.0	5	---	²⁵	---
PM ₁₀	1.0	5	---	---	---
NO _x	1.0	---	---	---	---
CO	---	---	0.5	---	2

(B) Notwithstanding the provisions of Chapter 6, Section 2(c)(ii)(A) above, no facility with the potential to emit 100 tons per year or more of PM₁₀ (including sources of fugitive dust) shall be allowed to construct within the City of Sheridan designated PM₁₀ nonattainment area until such time as the area is redesignated to an attainment area for PM₁₀ ambient standards in accordance with section 107 of the Clean Air Act. In addition, no existing facility with the potential to emit 100 TPY or more of PM₁₀ within the Sheridan designated PM₁₀ nonattainment area shall be allowed to modify operations to increase potential PM₁₀ emissions by 15 tons per year or more (including sources of fugitive dust), until such time as the area is redesignated by EPA as an attainment area for PM₁₀ ambient standards. For the purpose of this paragraph, "potential to emit" shall have the same meaning as in Chapter 6, Section 4.

(iii) The proposed facility will not cause significant deterioration of existing ambient air quality in the Region as defined by any Wyoming standard or regulation that might address significant deterioration.

(iv) The proposed facility will be located in accordance with proper land use planning as determined by the appropriate state or local agency charged with such responsibility.

(v) The proposed facility will utilize the Best Available Control Technology with consideration of the technical practicability and economic reasonableness of reducing or eliminating the emissions resulting from the facility. For large mining operations, specific measures normally required and to be considered include but are not limited to:

- (A) The paving of access roads;
- (B) The treating of major haul roads with a suitable dust suppressant;
- (C) The treatment of temporary haul roads;
- (D) The use of silos, trough barns, or similar enclosed containers for the storage of large volumes of material awaiting load out and shipment;
- (E) The treatment of active work areas; and
- (F) The treatment of temporary ore stockpiles.

(vi) The proposed facility will have provisions for measuring the emissions of significant air contaminants as determined by the Administrator of the Division of Air Quality.

(vii) The proposed facility will achieve the performance specified in the application for the permit to construct or modify.

(viii) The proposed facility will not emit any air pollutant in amounts which will (i) prevent attainment or maintenance by any other state of any such national primary or secondary Ambient Air Quality Standard or (ii) interfere with measures required by the Federal Clean Air Act to be included in the applicable Implementation Plan for any other state to prevent significant deterioration of air quality or to protect visibility.

(d) In meeting the requirements of Chapter 6, Section 2(c) above pertaining to compliance with an applicable Ambient Air Quality Standard or increment, the degree of

emission limitation required shall not be affected by (a) so much of the stack height of any source as exceeds good engineering practice stack height or (b) any other dispersion technique.

(i) For purposes of this requirement, “good engineering practice stack height” means the height equal to or less than:

(A) 30 meters as measured from the ground-level elevation at the base of the stack, or

(B) $H + 1.5L$ where H is the height of nearby structure(s) measured from the ground level elevation at the base of the stack and L is the lesser dimension (height or width) of, the source, or nearby structure, provided that the Administrator may require the use of a field study or fluid model to verify good engineering practice stack height for the source, or

(C) Such other height as is demonstrated by a fluid model or a field study approved by the Administrator, which ensures that emissions from a stack do not result in excessive concentrations in the immediate vicinity of the source as a result of atmospheric downwash, eddies, or wakes which may be created by the source, nearby structures or nearby terrain features.

(ii) For purposes of this requirement, “dispersion technique” means any technique which attempts to affect the concentration of a pollutant in the ambient air by:

(A) Using that portion of a stack which exceeds good engineering practice stack height, or

(B) Varying the rate of emission of a pollutant according to atmospheric conditions or ambient concentrations of that pollutant, or

(C) Increasing the final exhaust gas plume rise by manipulating source process parameters, exhaust gas parameters, stack parameters, or combining exhaust gases from several existing stacks into one stack, or other selective manipulation of exhaust gas streams so as to increase the exhaust gas plume rise.

(iii) For purposes of this requirement, “dispersion technique” does not include:

(A) The reheating of a gas stream, following use of a pollution control system, for the purpose of returning the gas to the temperature at which it was originally discharged from the facility generating the gas stream, or

(B) The merging of exhaust gas streams where the source owner or operator demonstrates that the facility was originally designed and constructed with such merged streams.

(iv) For the purposes of this requirement, “emission limitation” means a requirement established by the Administrator which limits the quantity, rate, or concentration of emissions of air pollutants on a continuous basis, including any requirements which limit the level of opacity, prescribe equipment, set fuel specifications, or prescribe operation or maintenance procedures for a source to assure continuous emission reduction.

(v) “Nearby” as used in Chapter 6, Section 2(d)(i) is defined for a specific structure or terrain feature, and

(A) For purposes of applying the formula provided in Chapter 6, Section 2(d)(i)(B) means that distance up to five times the lesser of the height or the width dimension of a structure, but not greater than one half mile (0.8 km), and

(B) For conducting demonstrations under Chapter 6, Section 2(d)(i)(C) means not greater than one half mile (0.8 km), except that the portion of a terrain feature may be considered to be nearby which falls within a distance of up to 10 times the maximum height of the feature, not to exceed 2 miles if such feature achieves a height one half mile from the stack that is at least 40 percent of the GEP stack height determined by the formula provided in Chapter 6, Section 2(d)(i)(B) or 26 meters, whichever is greater, as measured from the ground-level elevation at the base of the stack. The height of the structure of terrain feature is measured from the ground-level elevation at the base of the stack.

(vi) “**Excessive concentration**” is defined for the purpose of determining good engineering practice stack height under Chapter 6, Section 2(d)(i)(C) and means,

(A) For sources seeking credit for stack height exceeding that established under Chapter 6, Section 2(d)(i)(B), a maximum ground-level concentration due to emissions from a stack due in whole or part to downwash, wakes, and eddy effects produced by nearby structures or nearby terrain features which individually is at least 40 percent in excess of the maximum concentration experienced in the absence of such downwash, wakes, or eddy effects and which contributes to a total concentration due to emissions from all sources that is greater than an ambient air quality standard. For sources subject to the prevention of significant deterioration (Chapter 6, Section 4), an excessive concentration alternatively means a maximum ground-level concentration due to emissions from a stack due in whole or part to downwash, wakes, or eddy effects produced by nearby structures or nearby terrain features which individually is at least 40 percent in excess of the maximum concentration experienced in the absence of such downwash, wakes, or eddy effects and greater than a prevention of significant

deterioration increment. The allowable emission rate to be used in making demonstrations under this section shall be prescribed by the new source performance standard that is applicable to the source category unless the owner or operator demonstrates that this emission rate is infeasible. Where such demonstrations are approved by the Administrator, an alternative emission rate shall be established in consultation with the source owner or operator.

(vii) After the Administrator has reached a proposed decision to approve or disapprove a permit application in which the source relies on a good engineering practice stack height that exceeds the height allowed by Chapter 6, Section 2(d)(i)(A) or (B) the Administrator will notify the public of the availability of the demonstration study and provide the opportunity for public hearing. Specific notification of the Administrator's decision, availability of the demonstration and opportunity for public hearing will be included as part of the public notice required in Chapter 6, Section 2(m) of these regulations.

(e) No permit to operate may be granted until the applicant demonstrates to the satisfaction of the Administrator of the Division of Air Quality that:

(i) The facility is complying with the Wyoming Air Quality Standards and Regulations applicable at the time the permit to construct or modify was granted and with the intent of the Wyoming Environmental Quality Act, 1973.

(ii) The facility has been constructed or modified in accordance with the requirements and conditions contained in the permit to construct or modify.

(f) The Administrator of the Division of Air Quality may impose any reasonable conditions upon an approval to construct, modify, or operate including, but not limited to, conditions requiring the source to be provided with:

(i) Sampling and testing facilities as the Administrator may require;

(ii) Safe access to the sampling facilities;

(iii) Instrumentation to monitor and record emission data; and

(iv) Ambient Air Quality monitoring which, in the judgment of the Administrator, is necessary to determine the effect which emissions from a source may have, or is having, on air quality in any area which may be affected by emissions from such source.

(g) The Administrator will review each application within 30 days and notify the applicant as to whether or not the application is complete. If the application is complete, the Administrator will propose approval, conditional approval or denial and will publish

such proposal within 60 days of the determination that the application is complete. If the application is not complete, the application will be considered inactive and additional information as necessary will be requested. A complete application shall include all materials and analyses which the Administrator determines are necessary for the Division to review the facility as a source of air pollution.

(h) A permit to construct or modify shall remain in effect until the permit to operate the facility for which the application was filed is granted or denied or the application is canceled. However, an approval to construct or modify shall become invalid if construction is not commenced within 24 months after receipt of such approval or if construction is discontinued for a period of 24 months or more. The Administrator may extend such time period(s) upon a satisfactory showing that an extension is justified. This provision does not apply to the time period between construction of the approved phases of a phased construction project; however, each phase must commence construction within 24 months of the projected and approved commencement date for such phase. Notwithstanding the above, a permit containing a case-by-case MACT determination pursuant to Chapter 6, Section 6 shall expire if construction or reconstruction has not commenced within 18 months of issuance, unless the Division has granted an extension which shall not exceed an additional 12 months.

(i) Any owner or operator subject to the provisions of this regulation shall furnish the Administrator written notification as follows:

(i) A notification of the anticipated date of initial start-up of each source not more than 60 days or less than 30 days prior to such date.

(ii) A notification of the actual date of initial start-up of each source within 15 days after such date.

(j) Within 30 days after achieving the maximum design production rate for which the permit is approved and at which each source will be operated, but not later than 90 days after initial start-up of such source, the owner or operator of such source shall conduct a performance test(s) in accordance with methods and under operating conditions approved by the Administrator and furnish the Administrator a written report of the results of each performance test.

(i) Such test shall be at the expense of the owner or operator.

(ii) The Administrator may monitor such test and may also conduct performance tests.

(iii) The owner or operator of a source shall provide the Administrator 15 days prior notice of the performance test to afford the Administrator the opportunity to have an observer present.

(iv) The Administrator may waive the requirement for performance tests if the owner or operator of a source has demonstrated by other means to the Administrator's satisfaction that the source is being operated in compliance with all State and Federal Regulations which are part of the applicable plan.

(v) If the maximum design production rate for which the permit is approved is not achieved within 90 days of initial start-up, testing will be conducted on a schedule to be defined by the Administrator. This schedule may require that the source be tested at the production rate achieved within 90 days of initial start-up and again when maximum design production rate is achieved.

(k) Approval to construct or modify shall not be required for:

(i) The installation or alteration of an air pollutant detector, air pollutants recorder, combustion controller, or combustion shutoff.

(ii) Air conditioning or ventilating systems not designed to remove air pollutants generated by or released from equipment.

(iii) Fuel burning equipment other than a smokehouse generator which has a heat input of not more than 25 million BTU per hour (6.25 billion gm-cal/hr) and burns only gaseous fuel containing not more than 20 grains total sulfur per 100 std. ft³; has a heat input of not more than 10 million BTU/hr (2.5 billion gm-cal/hr) and burns any other fuel.

(iv) Mobile internal combustion engines.

(v) Laboratory equipment used exclusively for chemical or physical analyses.

(vi) The installation of air pollution control equipment which is not a part of a project which requires a construction or modification permit under Chapter 6, Section 2 or 4 of these regulations.

(vii) Gasoline storage tanks at retail establishments.

(viii) Such other minor sources which the Administrator determines to be insignificant in both emission rate and ambient air quality impact.

Notwithstanding the above exemptions, any facility which is a major emitting facility pursuant to the definition in Chapter 6, Section 4 shall comply with the requirements of both Chapter 6, Sections 2 and 4.

(l) Approval to construct or modify shall not relieve any owner or operator of the responsibility to comply with all local, state and federal rules and regulations.

(m) After the Administrator has reached a proposed decision based upon the information presented in the permit application to construct or modify, the Division of Air Quality will advertise such proposed decision in a newspaper of general circulation in the county in which the source is proposed. This advertisement will indicate the general nature of the proposed facility, the proposed approval/disapproval of the permit, and a location in the region where the public might inspect the information submitted in support of the requested permit and the Air Quality Division's analysis of the effect on air quality. A copy of the public notice required above will be sent as appropriate to (a) the applicant, (b) the U.S. EPA, (c) any affected comprehensive regional land use planning agency, (d) affected county commissioners, (e) any state or federal land manager or Indian governing body whose lands may be significantly affected by emissions from the proposed facility. The public notice will include notification of the opportunity for a public hearing and will indicate the anticipated degree of increment consumption if the source is subject to Chapter 6, Section 4 of these Regulations. The public will be afforded a 30-day period in which to make comments and recommendations to the Division of Air Quality. A public hearing may be called if sufficient interest is generated or if any aggrieved party so requests in writing within the 30-day comment period. After considering all comments, including those presented at any hearings held, the Administrator will reach a decision and notify the appropriate parties.

(n) (i) Within 30 days of receipt of a permit application for a new major emitting facility or major modification which is subject to the provisions of Chapter 6, Section 4, but not later than 60 days prior to public notice issued under Chapter 6, Section 2(m) above, the Administrator shall provide written notification to all Federal Class I Area Federal Land Managers of such proposed new major emitting facility or major modification whose emissions may affect the Federal Class I Area or affect visibility in such Area. This notification must contain a copy of all information relevant to the permit application including an analysis of the anticipated impacts on air quality and visibility in any Federal Class I Area.

(ii) Within 30 days of receipt of advance notification of a permit application for a new source or facility which may be subject to Chapter 6, Section 4, and which may affect visibility in a Federal Class I Area, the Administrator shall notify the affected Federal Land Manager of such advance notification.

(o) A permit fee will be assessed on the owner or operator (applicant), based on the cost to the Department in reviewing and acting on permit applications submitted to the Division under this section.

(i) Fees for Reviewing the Application: The Department shall provide written notice of the fee to the applicant at such time as the Administrator of the Division reaches a proposed decision on the application under paragraph (m) of this section.

(A) The fee shall include all costs incurred by the Department in reviewing the application to this point in the permit process including the costs of advertising such decision and providing public notice.

(B) The fee is due upon receipt of the written notice unless the fee assessment is appealed pursuant to W.S. 35-11-211(d).

(C) Payment of this fee shall be required before the issuance of any permit under this section.

(ii) Fees for Issuing Permit: An additional fee shall be assessed and written notice provided to the applicant for any additional costs incurred by the Department (after the date of public notice) in reaching a final decision, including the costs of holding public hearings, reviewing public comments, and issuing permits.

(iii) Portable sources or facilities shall be assessed a fee of \$100.00 for operation in each new location. This fee shall be submitted with each “self issuance” permit submitted to the Division for operation under Chapter 6, Section 2(a)(iv) and Chapter 6, Section 2(b) of these regulations. For portable sources or facilities which are not authorized to use the “self issuance” permits, the fee assessment shall be \$250.00 for operation at each new location.

Section 3. **Operating permits.**

(a) Applicability. The following sources are subject to the operating permit requirements of this section:

(i) Any major source;

(ii) Any source, including an area source, subject to a standard, limitation, or other requirement under section 111 of the Act and Chapter 5, Section 2 of the WAQSR;

(iii) Any source, including an area source, subject to a standard or other requirement under section 112 of the Act, except that a source is not required to obtain a permit solely because it is subject to regulations or requirements under section 112(r) of the Act;

(iv) Any “affected source” subject to the acid rain provisions of title IV of the Act;

(v) Any stationary source subject to preconstruction review requirements pursuant to the Prevention of Significant Deterioration of Chapter 6, Section 4 of the WAQSR;

(vi) Any other stationary source in a source category that the EPA may designate by regulation pursuant to the authority granted under the Act.

(vii) The following sources are specifically exempt from operating permit requirements of this section:

(A) Sources subject to Chapter 5, Section 2, Subpart AAA - Standards of Performance for New Residential Wood Heaters; and

(B) Sources subject to the asbestos standards for demolition and renovation of Chapter 3, Section 8.

(viii) Permitted sources which are not subject to the requirements of this section must obtain an operating permit under Chapter 6, Section 2.

(ix) Research and Development Activities. Emissions from research and development facilities which are support facilities collocated with another source under common ownership or control must be included (along with other emissions from the source) in determining the applicability of Chapter 6, Section 3 if fifty (50) percent or more of the output from the research and development facility is used by the main activity at the source. Otherwise, research and development operations may be considered as separate and discrete stationary sources in determining whether such operations are subject to Chapter 6, Section 3 operating permit requirements.

(x) Emissions Units and Chapter 6, Section 3 Sources.

(A) For major sources, the Division shall include in the permit all applicable requirements for all relevant emissions units in the major source.

(B) For any nonmajor source subject to the Chapter 6, Section 3 program under paragraph Chapter 6, Section 3(a), the Division shall include in the permit all applicable requirements applicable to emissions units that cause the source to be subject to the Chapter 6, Section 3 program.

(xi) Fugitive Emissions. Fugitive emissions from a Chapter 6, Section 3 source shall be included in the permit application and the Chapter 6, Section 3 permit in the same manner as stack emissions, regardless of whether the source category in question is included in the list of sources contained in the definition of major source.

(b) Definitions. The following definitions apply to Chapter 6, Section 3. Unless defined differently below, the meaning of the terms used in this section is the same as in Chapter 1, Section 3; Chapter 5, Section 2; Chapter 6, Section 4 of the WAQSR.

(i) “**Act**” means the Clean Air Act, as amended, 42 U.S.C. 7401, et seq.

(ii) “**Affected source**” shall have the meaning given to it in regulations promulgated under Title IV of the Act for the acid rain program.

(iii) “**Affected states**” are all states:

(A) Whose air quality may be affected and that are contiguous to the State of Wyoming where an operating permit, permit modification or permit renewal subject to the provisions of this section is being proposed; or

(B) That are within fifty miles of the permitted source.

(iv) “**Affected unit**” shall have the meaning given to it in the regulations promulgated under Title IV of the Act.

(v) “**Applicable requirement**” means all of the following as they apply to emissions units at a source subject to this section (including requirements with future effective compliance dates that have been promulgated or approved by the EPA or the State through rulemaking at the time of issuance of the operating permit):

(A) Any standard or other requirement provided for in the Wyoming implementation plan approved or promulgated by the EPA under title I of the Act that implements the relevant requirements of the Act, including any revisions to the plan promulgated in 40 CFR part 52;

(B) Any standards or requirements in the WAQSR which are not a part of the approved Wyoming implementation plan and are not federally enforceable;

(C) Any term or condition of any preconstruction permits issued pursuant to regulations approved or promulgated through rulemaking under Title I, including parts C or D of the Act and including Chapter 5, Section 2 and Chapter 6, Sections 2 and 4 of the WAQSR;

(D) Any standard or other requirement promulgated under section 111 of the Act, including section 111(d) and Chapter 5, Section 2 of the WAQSR;

(E) Any standard or other requirement under section 112 of the Act, including any requirement concerning accident prevention under section 112(r)(7) of

the Act and including any regulations promulgated by the EPA and the State pursuant to Section 112 of the Act;

(F) Any standard or other requirement of the acid rain program under Title IV of the Act or the regulations promulgated thereunder;

(G) Any requirements established pursuant to section 504(b) or section 114(a)(3) of the Act concerning enhanced monitoring and compliance certifications;

(H) Any standard or other requirement governing solid waste incineration, under section 129 of the Act;

(I) Any standard or other requirement for consumer and commercial products, under section 183(e) of the Act (having to do with the release of volatile organic compounds under ozone control requirements);

(J) Any standard or other requirement of the regulations promulgated to protect stratospheric ozone under Title VI of the Act, unless the EPA has determined that such requirements need not be contained in a Title V permit;

(K) Any national ambient air quality standard or increment or visibility requirement under part C of Title I of the Act, but only as it would apply to temporary sources permitted pursuant to section 504(e) of the Act; and

(L) Any state ambient air quality standard or increment or visibility requirement of the WAQSR.

(M) Nothing under paragraph (b)(v) of this section shall be construed as affecting the allowance program and Phase II compliance schedule under the acid rain provision of Title IV of the Act.

(vi) “**Commencement of operation**” means the setting into operation of a new or modified source (subject to the provisions of this section) for any purpose.

(vii) “**Department**” means the Wyoming Department of Environmental Quality or its Director.

(viii) “**Designated representative**” or “**alternate designated representative**” shall have the meaning given to it in the regulations promulgated under Title IV of the Act.

(ix) “**Division**” means the Air Quality Division of the Wyoming Department of Environmental Quality or its Administrator.

(x) **“Draft permit”** means the version of a permit for which the Division offers public notice and an opportunity for public comment and hearing.

(xi) **“Emissions allowed under the permit”** means a federally enforceable permit term or condition determined at issuance to be required by an applicable requirement that establishes an emissions limit (including a work practice standard) or a federally enforceable emissions cap that the source has assumed to avoid an applicable requirement to which the source would otherwise be subject.

(xii) **“Emissions unit”** means any part or activity of a stationary source that emits or has the potential to emit any regulated air pollutant or any pollutant listed under section 112(b) of the Act. This term is not meant to alter or affect the definition of the term “unit” for purposes of Title IV of the Act.

(xiii) **“EPA”** means the Administrator of the U.S. Environmental Protection Agency or the Administrator’s designee.

(xiv) **“Final permit”** means the version of an operating permit under this section issued by the Division that has completed all review procedures required by Chapter 6, Section 3(d) and Section 3(e).

(xv) **“Fugitive emissions”** means those emissions which could not reasonably pass through a stack, chimney, vent, or other functionally equivalent opening.

(xvi) **“General permit”** means an operating permit under this section that meets the requirements of Chapter 6, Section 3(i).

(xvii) **“Major source”** means any stationary source (or any group of stationary sources that are located on one or more contiguous or adjacent properties, and are under common control of the same person or persons under common control) belonging to a single major industrial grouping and this is described in paragraphs (A), (B), or (C) of this definition. For the purpose of defining “major source”, a stationary source or group of stationary sources shall be considered part of a single industrial grouping if all of the pollutant emitting activities at such source or group of sources on contiguous or adjacent properties belong to the same Major Group (i.e., all have the same two-digit code) as described in the Standard Industrial Classification Manual, 1987.

(A) A major source under section 112 of the Act, which is defined as:

(I) For pollutants other than radionuclides, any stationary source or group of stationary sources located within a contiguous area and under common control that emits or has the potential to emit, in the aggregate, 10 tons per year (tpy) or more of any hazardous air pollutant which has been listed pursuant to section 112(b) of

the Act, 25 tpy or more of any combination of such hazardous air pollutants, or such lesser quantity as the EPA may establish by rule. Notwithstanding the preceding sentence, emissions from any oil or gas exploration or production well (with its associated equipment) and emissions from any pipeline compressor or pump station shall not be aggregated with emissions from other similar units, whether or not such units are in a contiguous area or under common control, to determine whether such units or stations are major sources; or

(II) For radionuclides, “major source” shall have the meaning specified by the EPA by rule.

(B) A major stationary source of air pollutants, as defined in section 302 of the Act, that directly emits or has the potential to emit, 100 tpy or more of any air pollutant (including any major source of fugitive emissions of any such pollutant, as determined by rule by the EPA). Emissions of air pollutants regulated solely due to section 112(r) of the Act shall not be considered in determining whether a source is a “major source” for purposes of Chapter 6, Section 3 applicability. The fugitive emissions of a stationary source shall not be considered in determining whether it is a major stationary source unless the source belongs to one of the following categories of stationary sources:

(I) Stationary sources listed in Chapter 6, Section 4(a)(i)(a) of the WAQSR; or

(II) Any other stationary source category, which as of August 7, 1980 is being regulated under section 111 or 112 of the Act.

(C) A major stationary source as defined in part D of Title I of the Act (in reference to sources located in non-attainment areas).

(xviii) “**Operating permit**” means any permit or group of permits covering a source under this section that is issued, renewed, amended, or revised pursuant to this section.

(xix) “**Permit modification**” means a revision to an operating permit that meets the requirements of Chapter 6, Section 3(d)(vi).

(xx) “**Permit revision**” means any permit modification or administrative permit amendment.

(xxi) “**Potential to emit**” means the maximum capacity of a stationary source to emit any air pollutant under its physical and operational design. Any physical or operational limitation on the capacity of a source to emit an air pollutant, including air pollution control equipment and restrictions on hours of operation or on the type or

amount of material combusted, stored or processed, shall be treated as part of its design if the limitation is enforceable by the EPA and the Division. This term does not alter or affect the use of this term for any other purposes under the Act, or the term “capacity factor” as used in Title IV of the Act or the regulations promulgated thereunder.

(xxii) “**Proposed permit**” means the version of a permit that the Division proposes to issue and forwards to the EPA for review.

(xxiii) “**Regulated air pollutant**” means the following:

(A) Nitrogen oxides (NO_x) or any volatile organic compound;

(B) Any pollutant for which a national ambient air quality standard has been promulgated;

(C) Any pollutant that is subject to any standard established in Chapter 5, Section 2 of the WAQSR or section 111 of the Act;

(D) Any Class I or II substance subject to a standard promulgated under or established by Title VI of the Act; or

(E) Any pollutant subject to a standard promulgated under section 112 or other requirements established under section 112 of the Act, including sections 112(g), (j), and (r) of the Act, including the following:

(I) Any pollutant subject to requirements under section 112(j) of the Act. If the EPA fails to promulgate a standard by the date established pursuant to section 112(e) of the Act, any pollutant for which a subject source would be major shall be considered to be regulated on the date 18 months after the applicable date established pursuant to section 112(e) of the Act; and

(II) Any pollutant for which the requirements of section 112(g)(2) of the Act have been met, but only with respect to the individual source subject to section 112(g)(2) requirement.

(F) Pollutants regulated solely under section 112(r) of the Act are to be regulated only with respect to the requirements of section 112(r) for permits issued under this section.

(xxiv) “**Regulated pollutant (for fee calculation)**”, which is used only for purposes of Chapter 6, Section 3(f), means any “regulated air pollutant” except the following:

(A) Carbon monoxide;

(B) Any pollutant that is a regulated air pollutant solely because it is a Class I or II substance subject to a standard promulgated under or established by Title VI of the Act; or

(C) Any pollutant that is a regulated air pollutant solely because it is subject to a standard or regulation under section 112(r) of the Act.

(xxv) **“Renewal”** means the process by which a permit is reissued at the end of its term.

(xxvi) **“Responsible official”** means one of the following:

(A) For a Corporation:

(I) A president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision-making functions for the corporation; or

(II) A duly authorized representative of such person if the representative is responsible for the overall operation of one or more manufacturing, production, or operating facilities applying for or subject to a permit and either:

(1.) The facilities employ more than 250 persons or have gross annual sales or expenditures exceeding \$25 million (in second quarter 1980 dollars); or

(2.) The delegation of authority to such representative is approved in advance by the Division;

(B) For a Partnership or Sole Proprietorship: a general partner or the proprietor, respectively;

(C) For a Municipality, State, Federal, or Other Public Agency: Either a principal executive officer or ranking elected official. For the purposes of this part, a principal executive officer of a federal agency includes the chief executive officer having responsibility for the overall operations of a principal geographic unit of the agency; or

(D) For Affected Sources:

(I) The designated representative or alternate designated representative in so far as actions, standards, requirements, or prohibitions under Title IV of the Act or the regulations promulgated thereunder are concerned; and

(II) The designated representative, alternate designated representative, or responsible official under Chapter 6, Section 3(b)(xxvi) for all other purposes under this section.

(xxvii) **“Section 502(b)(10) changes”** are changes that contravene an express permit term. Such changes do not include changes that would violate applicable requirements or contravene federally enforceable permit terms and conditions that are monitoring (including test methods), recordkeeping, reporting or compliance certification requirements.

(xxviii) **“Source”** means any stationary source or area source (if subject to a standard, limitation or other requirement under section 111 or 112 of the Act).

(xxix) **“State”** means any non-Federal permitting authority, including any local agency, interstate association, or statewide program. “State” shall have its conventional meaning where such meaning is clear from the context.

(xxx) **“Stationary source”** means any building, structure, facility, or installation that emits or may emit any regulated air pollutant or any pollutant listed under section 112(b) of the Act.

(xxxi) **“WAQSR”** means the Wyoming Air Quality Standards and Regulations promulgated under the Wyoming Environmental Quality Act, W.S. § 35-11-101 *et seq.*

(c) Permit Applications. Any stationary source or group of stationary sources subject to this section shall submit a timely and complete permit application in accordance with this paragraph.

(i) Timely Application.

(A) A timely application for a source applying for an operating permit under this section for the first time is one that is submitted to the Division within twelve (12) months after the source becomes subject to this section.

(B) Every stationary source or group of stationary sources which are subject to this section under paragraph (a), and which is required to obtain a construction or modification permit under Chapter 5, Section 2 or Chapter 6, Section 2 or 4 of the WAQSR or section 112(g) of the Act shall file a complete application to obtain an operating permit within twelve (12) months after commencing operation. Where an existing operating permit would prohibit such construction or change in operation, the owner or operator must obtain a permit revision before commencing operation.

(C) For the purpose of an operating permit renewal, a timely application is one that is submitted at least six (6) months, but no earlier than eighteen (18) months, prior to the date of the permit expiration.

(D) Transition Period. Initial operating permit applications for sources subject to this section shall be submitted as follows:

(I) Permit applications for operating natural gas compressor engines, operating natural gas sweetening plants, and operating natural gas processing plants subject to the standards of performance of Subpart KKK of Chapter 5, Section 2 of the WAQSR, shall be submitted within four (4) months of the EPA's approval of this operating permit program, but not later than November 15, 1995. This requirement for the early submittal of permit applications includes only major sources as defined in Chapter 6, Section 3(b)(xvi).

(II) Permit applications for all other operating sources subject to this section shall be submitted within twelve (12) months of the EPA's approval of this operating permit program, but not later than November 15, 1995.

(III) Applications for affected facilities addressing State and federal requirements, other than Title IV acid rain program requirements, shall be submitted to the Division within twelve (12) months of EPA approval of the operating permit program, but no later than November 15, 1995. Applications for phase II acid rain permits and all other acid rain permits for affected facilities shall be submitted in accordance with the acid rain permit application deadlines of Chapter 11, Section 2(c)(i)(B).

(IV) All sources listed at Chapter 6, Section 3(a) that are not major sources, affected sources, or solid waste incineration units required to obtain a permit pursuant to section 129(e) of the Act, shall submit a permit application pursuant to this section at such time as the EPA requires such sources to obtain an operating permit in final regulations promulgated pursuant to Title V of the Act.

(ii) Complete Application.

(A) Operating permit applications shall be submitted on the Division's standard operating permit application forms and any required EPA Title IV acid rain permit forms. The information which must be included in the permit application is specified below:

(I) Identifying information, including company name and address (or plant name and address if different from the company name), owner's name and agent, and telephone number and names of plant site manager/contact.

(II) A description of the source's processes and products (by Standard Industrial Classification Code) including any associated with alternate scenarios identified by the source.

(III) The following emissions related information:

(1.) All emissions of pollutants for which the source is major, and all emissions of regulated air pollutants. The permit application shall describe all emissions of regulated air pollutants emitted from any emissions unit. Sufficient information shall be provided to verify which requirements are applicable to the source, and other information necessary to collect any permit fees owed under the fee schedule developed pursuant to Chapter 6, Section 3(f).

The source shall not be required to furnish the above information for insignificant activities and emission levels such as maintenance, cleaning and painting, welding, chemical storage and transfer, and other activities which are incidental to the source's primary business activity and which result in emissions of less than one ton per year of a regulated pollutant not included in the section 112(b) list of hazardous air pollutants or emissions less than 1000 pounds per year of a pollutant regulated pursuant to listing under section 112(b) of the Act. Provided however, such emission levels of hazardous air pollutants do not exceed exemptions based on insignificant emission levels established by EPA through rulemaking for modification under section 112(g) of the Act. The source shall list such insignificant activities, proposed for exclusion, in its application and certify that emissions from each of these activities are less than the above quantities. Activities and emissions which have applicable requirements shall not be excluded from the operating permit application.

(2.) Identification and description of all emission points and fugitive emission sources in sufficient detail to establish the basis for fees and applicability of requirements of the Act and the WAQSR.

(3.) Emission rates in tons per year and in such terms as are necessary to establish compliance consistent with the applicable emission standard and reference test method.

(4.) The following information to the extent it is emissions related: fuels, fuel use, raw materials, production rates, and operating schedules.

(5.) Identification and description of air pollution control equipment and compliance monitoring devices or activities.

(6.) Limitations on source operations affecting emissions or any work practice standards, where applicable, for all regulated pollutants.

(7.) Other information required by any applicable requirements (including information related to stack height limitations pursuant to Chapter 6, Section 2).

(8.) Calculations on which the information in items (1.) through (7.) is based.

(IV) The following air pollution control requirements:

(1.) Citation and description of all applicable requirements; and

(2.) Description of or reference to any applicable test method for determining compliance with each applicable requirement and permit limitation.

(V) Other specific information that may be necessary to implement, and enforce other requirements of the Act and the WAQSR or to determine the applicability of such requirements.

(VI) An explanation of any proposed exemptions from otherwise applicable requirements.

(VII) Additional information as determined to be necessary by the Division to define alternative operating scenarios identified by the source pursuant to Chapter 6, Section 3(h)(i)(I) or to define permit terms and conditions implementing Chapter 6, Section 3(h)(i)(J).

(VIII) A compliance plan that contains the following:

(1.) A description of the compliance status of the source with respect to all applicable requirements.

(2.) A description as follows:

a. For applicable requirements with which the source is in compliance, a statement that the source will continue to comply with such requirements.

b. For applicable requirements that will become effective during the permit term, a statement that the source will meet such requirements on a timely basis.

c. For requirements for which the source is not in compliance at the time of permit issuance, a narrative description of how the source will achieve compliance with such requirements.

(3.) A compliance schedule as follows:

a. For applicable requirements with which the source is in compliance, a statement that the source will continue to comply with such requirements.

b. For applicable requirements that will become effective during the permit term, a statement that the source will meet such requirements on a timely basis. A statement that the source will meet in a timely manner applicable requirements that become effective during the permit term shall satisfy this provision, unless a more detailed schedule is expressly required by the applicable requirement.

c. A schedule of compliance for sources that are not in compliance with all applicable requirements at the time of permit issuance. Such a schedule shall include a schedule of remedial measures, including an enforceable sequence of actions with milestones, leading to compliance with any applicable requirements for which the source will be in noncompliance at the time of permit issuance. This compliance schedule shall resemble and be at least as stringent as that contained in any judicial consent decree or administrative order to which the source is subject. Any such schedule of compliance shall be supplemental to, and shall not sanction noncompliance with, the applicable requirements on which it is based.

(4.) A schedule for submission of certified progress reports where applicable no less frequently than every six months for sources required to have a schedule of compliance to remedy a violation.

(5.) The compliance plan content requirements specified in this paragraph shall apply and be included in the acid rain portion of a compliance plan for an affected source, except as specifically superseded by regulations promulgated under Title IV of the Act with regard to the schedule and method(s) the source will use to achieve compliance with the acid rain emissions limitations.

(IX) Requirements for compliance certification, including the following:

(1.) A certification of compliance with all applicable requirements by a responsible official consistent with Chapter 6, Section 3(c)(iv) and section 114(a)(3) of the Act;

(2.) A statement of methods used for determining compliance, including a description of monitoring, recordkeeping, and reporting requirements and test methods;

(3.) A schedule for submission of compliance certifications during the permit term, to be submitted no less frequently than annually, or more frequently if specified by the underlying applicable requirement or this Division; and

(4.) A statement indicating the source's compliance status with any applicable enhanced monitoring and compliance certification requirements of the Act.

(X) The use of nationally standardized forms for acid rain portions of permit applications and compliance plans, as required by regulations promulgated under Title IV of the Act.

(B) Confidential Information. As provided in sections 35-11-1101(a) and 35-11-205(d) of the Wyoming Environmental Quality Act, upon a satisfactory showing that records, reports or information or particular parts thereof, other than emission and pollution data, if made public would divulge trade secrets, the records, reports or information or particular portions thereof shall be treated as confidential by the Division. The Division may also request under Chapter 6, Section 3(h)(i)(F)(V) that the applicant provide this information directly to the EPA.

(I) An applicant who submits information which it desires to be held confidential may do so by stamping the information as "Confidential" and submitting it in a separate envelope marked "Confidential".

(iii) Duty to Supplement. Any applicant who fails to submit any relevant facts or who has submitted incorrect information in a permit application shall, upon becoming aware of such failure or incorrect submittal, promptly submit such supplementary facts or corrected information. In addition, an applicant shall provide additional information as necessary to address any requirements that become applicable to the source after the date it filed a complete application but prior to release of a draft permit.

(iv) Certification. Any application form, report, or compliance certification submitted pursuant to the WAQSR shall require certification by a responsible official of truth, accuracy, and completeness. This certification and any other certification required under this part shall state that, based on information and belief formed after reasonable inquiry, the statements and information in the document are true, accurate, and complete.

(d) Permit Issuance, Renewal, Reopenings, and Revisions.

(i) Action on Application.

(A) A permit, permit revision, or renewal may be issued only if all of the following conditions have been met:

(I) The Division has received a complete application for a permit, permit modification, or permit renewal, except that a complete application need not be received before issuance of a general permit under Chapter 6, Section 3(i);

(II) Except for modifications qualifying for minor permit modification procedures under Chapter 6, Section 3(d)(vi), the Division has complied with the requirements for public participation specified in this section;

(III) The Division has complied with the requirements for notifying and responding to affected States as required in this section;

(IV) The conditions of the permit provide for compliance with all applicable requirements and requirements of this section; and

(V) The EPA has received a copy of the proposed permit and any notices required under this section, and has not objected to the issuance of the permit within the time period specified in this section.

(B) Except for permits issued during the initial transitional period or under regulations promulgated under Title IV of the Act for permitting affected units under the acid rain program, the Division shall take final action on each permit application, including a request for a permit modification or renewal within 18 months after receiving a complete permit application.

(C) Within 60 days of the receipt of the application, the Division shall provide notice of whether the application is complete. Unless additional information is requested subject to the application or if the applicant is otherwise notified of incompleteness, the application shall be deemed complete after this 60-day period. A completeness determination will not be made for minor permit modifications under Chapter 6, Section 3(d)(vi)(A) and (B).

(D) The Division shall provide a statement that sets forth the legal and factual basis for the draft permit conditions (including references to the applicable statutory or regulatory provisions). The Division will provide this statement to the EPA and any other person who requests it.

(E) The submittal of a complete permit application shall not affect the requirement that any source have a preconstruction permit under Chapter 6, Section 2 or 4 of the WAQSR.

(ii) Requirement for a Permit. Except as provided in this paragraph or in Chapter 6, Section 3(d)(iii), no source requiring an operating permit under Chapter 6, Section 3 may operate after the time that it is required to submit a timely and complete application, except in compliance with a permit issued under this section. If a source submits a timely and complete application for permit issuance (including for renewal), the source's failure to have an operating permit is not a violation of this part until the Division takes final action on the permit application, except as noted in this paragraph. This protection shall cease to apply after a completeness determination made pursuant to Chapter 6, Section 3(d)(i)(C), if the applicant fails to submit by the deadline specified in writing by the Division any additional information identified as being needed to process the application.

(iii) Changes for Which No Permit Revision is Required.

(A) A source may change operations without a permit revision, as allowed under section 502(b)(10) of the Act and W.S. § 35-11-206(f)(iii), provided that:

(I) The change is not a modification under any provision of Title I of the Act and does not violate applicable acid rain requirements under Title IV of the Act;

(II) The change has met the requirements of Chapter 6, Section 2 and is not a modification under Chapter 5, Section 2 or Chapter 6, Section 4 of the WAQSR and the changes do not exceed the emissions allowed under the permit (whether expressed therein as a rate of emissions or in terms of total emissions); and

(III) The source provides the EPA and the Division with written notification at least fourteen (14) days in advance of the proposed change. The source, the EPA, and the Division shall attach such notice to their copy of the relevant permit.

(1.) For each such change, the written notification required shall include a brief description of the change within the permitted source, the date on which the change will occur, any change in emissions, and any permit term or condition that is no longer applicable as a result of the change.

(2.) The permit shield described in Chapter 6, Section 3(k) shall not apply to any change made pursuant to Chapter 6, Section 3(d)(iii).

(iv) Permit Renewal and Expiration.

(A) Permits being renewed are subject to the same procedural requirements, including those for public participation, and affected State and EPA review, that apply to initial permit issuance.

(B) Permit expiration terminates the source's right to operate unless a timely and complete renewal application has been submitted consistent with Chapter 6, Section 3(d)(ii) and Chapter 6, Section 3(c)(i)(C).

(v) Administrative Permit Amendments.

(A) An "administrative permit amendment" is a permit revision that can accomplish one or more of the following changes:

(I) Corrects typographical errors;

(II) Identifies a change in the name, address, or phone number of any person identified in the permit, or provides a similar minor administrative change at the source;

(III) Requires more frequent monitoring or reporting by the permittee;

(IV) Allows for a change in ownership or operational control of a source where the Division determines that no other change in the permit is necessary, provided that a written agreement containing a specific date for transfer of permit responsibility, coverage and liability between the current and new permittees has been submitted to the Division;

(V) Incorporates into the operating permit the requirements from preconstruction review permits issued pursuant to Chapter 6, Sections 2 and 4 of the WAQSR, provided that the process for issuing the preconstruction permit meets procedural requirements substantially equivalent to those that would be applicable under Chapter 6, Section 3(d) and (e) if the change were subject to review as an operating permit modification, and that the permit meets compliance requirements substantially equivalent to those of Chapter 6, Section 3(h); or

(VI) Incorporates any other type of change which the EPA has determined as part of the approved operating permit program to be similar to Chapter 6, Section 3(d)(v)(A)(I) through (V) above.

(B) Administrative permit amendments for purposes of the acid rain portion of the permit shall be governed by regulations promulgated under Title IV of the Act.

(C) An administrative permit amendment may be made by the Division consistent with the following:

(I) The Division shall take final action on a request for an administrative permit amendment within 60 days from the receipt of the request, and my incorporate such changes without providing notice to the public or affected States provided that it designates any such permit revisions as having been made pursuant to this paragraph.

(II) The Division shall submit a copy of the revised permit to the EPA.

(III) The source may implement the changes addressed in the request for an administrative amendment immediately upon submittal of the request.

(D) The Division may, upon taking final action granting a request for an administrative permit amendment, allow coverage by the permit shield in Chapter 6, Section 3(k) for administrative permit amendments made pursuant to Chapter 6, Section 3(d)(v)(A)(V) which meet the relevant requirements of Chapter 6, Section 3(d), 3(h), and 3(e) for significant permit modifications.

(vi) Permit Modification. A permit modification is any revision to an operating permit which can not be accomplished as an administrative permit amendment under Chapter 6, Section 3(d)(v). A permit modification for purposes of the acid rain portion of the permit shall be governed by regulations promulgated under Title IV of the Act.

(A) Minor Permit Modification Procedures.

(I) Criteria.

(1.) Minor permit modification procedures shall be used only for those permit modifications that:

a. Do not violate any applicable requirement;

b. Do not involve significant changes to existing monitoring, reporting, or recordkeeping requirements in the permit;

c. Do not require or change a case-by-case determination of an emission limitation or other standard, or a source-specific determination for temporary sources of ambient impacts, or a visibility or increment analysis;

d. Do not seek to change a permit term or condition for which there is no corresponding underlying applicable requirement and that the source has assumed in order to avoid an otherwise applicable requirement. Such terms and conditions include:

1. A federally enforceable emissions cap assumed to avoid classification as a modification under any provision of Title I of the Act;

2. An alternative emissions limit approved pursuant to regulations promulgated under section 112(i)(5) of the Act concerning early reductions of hazardous air pollutants; and

3. A federally enforceable emissions cap assumed to avoid being subject to provisions of this section pursuant to Chapter 6, Section 3(m) regarding synthetic minors.

e. Are not modifications under any provision of title I of the Act; and

f. Are not required to be processed as a significant modification.

(2.) Notwithstanding Chapter 6, Sections 3(d)(vi)(A) and 3(d)(vi)(B), minor permit modification procedures may be used for permit modifications involving the use of economic incentives, marketable permits, emissions trading, and other similar approaches, to the extent that such minor permit modification procedures are explicitly provided for in the implementation plan.

(3.) Qualifying for a minor permit modification under this section does not relieve a source of its responsibility to obtain a modification permit under the preconstruction permit requirements of Chapter 6, Section 2 of the WAQSR.

(II) Application. An application requesting the use of minor permit modification procedures shall meet the requirements of Chapter 6, Section 3(c)(ii) and shall include the following:

(1.) A description of the change, the emissions resulting from the change, and any new applicable requirements that will apply if the change occurs;

(2.) The source's suggested draft permit;

(3.) Certification by a responsible official, consistent with Chapter 6, Section 3(c)(iv), that the proposed modification meets the criteria for use of minor permit modification procedures and a request that such procedures be used; and

(4.) Completed forms for the Division to use to notify the EPA and affected States as required under Chapter 6, Section 3(e).

(III) EPA and Affected State Notification. Within 5 working days of receipt of a complete permit modification application, the Division shall meet its obligation under Chapter 6, Sections 3(e)(i)(A) and 3(e)(ii)(A) to notify the EPA and affected States of the requested permit modification. The Division shall promptly send any notice required under Chapter 6, Section 3(e)(ii)(B) to the EPA.

(IV) Timetable for Issuance. The Division may not issue a final minor permit modification until after the EPA's 45-day review period or until EPA has notified the Division that EPA will not object to issuance of the permit modification, whichever is first, although the Division can approve the permit modification prior to that time. Within 90 days of the Division's receipt of an application under minor permit modification procedures or 15 days after the end of the EPA's 45-day review period under Chapter 6, Section 3(e)(ii)(D), whichever is later, the Division shall:

(1.) Issue the permit modification as proposed;

(2.) Deny the permit modification application;

(3.) Determine that the requested modification does not meet the minor permit modification criteria and should be reviewed under the significant modification procedures; or

(4.) Revise the draft permit modification and transmit to the EPA the new proposed permit modification as required by Chapter 6, Section 3(e)(i).

(V) Source's Ability to Make Change.

(1.) The Division will allow the source to make the change proposed in its minor permit modification application immediately after it files such application. After the source makes the change allowed by the preceding sentence, and until the Division takes any of the actions specified in Chapter 6, Sections 3(d)(vi)(A)(IV)(1.) through (3.), the source must comply with both the applicable requirements governing the change and the proposed permit terms and conditions. During this time period, the source need not comply with the existing permit terms and conditions it seeks to modify; however, if the source fails to comply with its proposed

permit terms and conditions during this time period, the existing permit terms and conditions it seeks to modify may be enforced against it.

(VI) Permit Shield. The permit shield under Chapter 6, Section 3(k) does not extend to minor permit modifications.

(B) Group Processing of Minor Permit Modifications. The Division may process groups of a source's applications for certain modifications eligible for minor permit modification processing.

(I) Criteria. Group processing of modifications may be used only for those permit modifications:

(1.) That meet the criteria for minor permit modification procedures under Chapter 6, Section 3(d)(vi)(A)(I)(1.); and

(2.) That are collectively below a threshold of 10 percent of the emissions allowed under the permit for the emissions unit for which the change is requested, 20 percent of the applicable definition of major source in Chapter 6, Section 3(b), or 5 tons per year, whichever is least.

(II) Application. An application requesting the use of group processing procedures shall meet the requirements of Chapter 6, Section 3(c)(ii) and shall include the following:

(1.) A description of the change, the emission resulting from the change, and any new applicable requirements that will apply if the change occurs.

(2.) The source's suggested draft permit.

(3.) Certification by a responsible official, consistent with Chapter 6, Section 3(c)(iv) that the proposed modification meets the criteria for use of group processing procedures and a request that such procedures be used.

(4.) A list of the source's other pending applications awaiting group processing, and a determination of whether the requested modification, aggregated with these other applications, equals or exceeds the threshold levels of this part.

(5.) Certification, consistent with Chapter 6, Section 3(c)(iv), that the source has notified EPA of the proposed modification. Such notification need only contain a brief description of the requested modifications.

(6.) Completed forms for the Division to use to notify the EPA and affected States as required under Chapter 6, Section 3(e).

(III) EPA and Affected State Notification. On a quarterly basis or within 5 business days of receipt of an application demonstrating that the aggregate of a source's pending applications equals or exceeds the threshold level of this part, whichever is earlier, the Division shall meet its obligation under Chapter 6, Sections 3(e)(i)(a) and 3(e)(ii)(a) to notify the EPA and affected States of the requested permit modifications. The Division shall send any notice required under Chapter 6, Section 3(e)(ii)(B) to the EPA.

(IV) Timetable for Issuance. The provisions of Chapter 6, Section 3(d)(vi)(A)(IV) shall apply to modifications eligible for group processing, except that the Division shall take one of the actions specified in Chapter 6, Sections 3(d)(vi)(A)(IV)(1.) through (4.) within 180 days of receipt of the application or 15 days after the end of the EPA's 45-day review period, whichever is later.

(V) Source's Ability to Make Change. The provisions of Chapter 6, Section 3(d)(vi)(A)(V) apply to modifications eligible for group processing.

(VI) Permit Shield. The permit shield under Chapter 6, Section 3(k) does not extend to modifications eligible for group processing.

(C) Significant Modification Procedures.

(I) Criteria. Significant modification procedures shall be used for applications requesting permit modifications that do not qualify as minor permit modifications or as administrative amendments. Every significant change in existing monitoring permit terms or conditions and every relaxation of reporting or recordkeeping permit terms or conditions shall require a permit modification under this paragraph. Nothing herein shall be construed to preclude the permittee from making changes consistent with this section that would render existing permit compliance terms and conditions irrelevant.

(II) Significant permit modifications shall meet all requirements of this section including those for applications, public participation, review by affected States, and review by EPA, as they apply to permit issuance and permit renewal. The Division shall complete review on the majority of significant permit modifications within 9 months after receipt of a complete application.

(vii) Reopening for Cause.

(A) Every operating permit issued shall contain provisions specifying the conditions under which the permit will be reopened prior to the expiration

of the permit. A permit shall be reopened and revised under any of the following conditions:

(I) Additional applicable requirements under the Act or the WAQSR become applicable to a major source subject to Chapter 6, Section 3 with a remaining permit term of 3 or more years. Such reopening shall be completed not later than 18 months after promulgation of the applicable requirement. No reopening is required if the effective date of the requirement is later than the date on which the permit is due to expire, unless the original permit or any of its terms and conditions has been extended.

(II) Additional requirements (including excess emissions requirements) become applicable to an affected source under the acid rain program. Upon approval of the EPA, excess emissions offset plans shall be deemed to be incorporated into the permit.

(III) The Division or the EPA determines that the permit contains a material mistake or that inaccurate statements were made in establishing the emissions standards or other terms or conditions of the permit.

(IV) The Division or the EPA determines that the permit must be revised or revoked to assure compliance with applicable requirements.

(B) Proceedings to reopen and issue a permit shall follow the same procedures as apply to initial permit issuance and shall affect only those parts of the permit for which cause to reopen exists. Such reopening shall be made as expeditiously as practicable.

(C) Reopenings under Chapter 6, Section 3(d)(vii)(A) shall not be initiated before a notice of such intent is provided to the source by the Division at least 30 days in advance of the date that the permit is to be reopened, except that the Division may provide a shorter time period in the case of an emergency.

(viii) Reopenings for Cause by the Environmental Protection Agency.

(A) If the EPA finds that cause exists to terminate, modify or revoke and reissue a permit pursuant to Chapter 6, Section 3(d)(vii), the EPA will notify the Division and the permittee of such finding in writing.

(B) The Division shall, within 90 days after receipt of such notification, forward to EPA a proposed determination of termination, modification, or revocation and reissuance, as appropriate. The EPA may extend this 90-day period for an additional 90 days if a new or revised permit application is necessary or if the Division must require the permittee to submit additional information.

(C) The EPA shall review the proposed determination from the Division within 90 days of receipt.

(D) The Division shall have 90 days from receipt of an EPA objection to resolve the objection and to terminate, modify or revoke and reissue the permit in accordance with the EPA's objection.

(E) If the Division fails to submit a proposed determination or fails to resolve any EPA objection, the EPA will terminate, modify, or revoke and reissue the permit after taking the following actions:

(I) Providing at least 30 day's notice to the permittee in writing of the reasons for any such action; and

(II) Providing the permittee an opportunity for comment on the EPA's proposed action and an opportunity for a hearing.

(ix) Public Participation. Except for modification qualifying for minor permit modification procedures, all permit proceedings, including initial permit issuance, significant modifications, and renewals, shall provide procedures for public notice including offering an opportunity for public comment and a hearing on the draft permit. These procedures shall include the following:

(A) Notice shall be given by publication in a newspaper of general circulation in the area where the source is located or in a State publication designed to give general public notice; to persons on a mailing list developed by the Division, including those who request in writing to be on the list; and by other means if necessary to assure adequate notice to the affected public;

(B) The notice shall identify the affected source; the name and address of the permittee; the name and address of the Division; the activity or activities involved in the permit action; the emissions change involved in any permit modification; the name, address, and telephone number of a person from whom interested persons may obtain additional information, including copies of the permit draft, the application, all relevant supporting materials, and all other materials available to the Division that are relevant to the permit decision; a brief description of the comment procedures; and the time and place of any hearing that may be held, including a statement of procedures to request a hearing (unless a hearing has already been scheduled);

(C) The Division shall provide such notice and opportunity for participation by affected States as provided in Chapter 6, Section 3(e);

(D) Timing. The Division shall provide for a 30-day period for public comment and shall give notice of any public hearing at least 30 days in advance of the hearing.

(E) The Division shall keep a record of the commenters and also of the issues raised during the public participation process so that the EPA may fulfill its obligation under section 505(b)(2) of the Act to determine whether a citizen petition may be granted, and such records shall be available to the public.

(e) Permit Review by the Environmental Protection Agency and Affected States.

(i) Information Provided to the Environmental Protection Agency.

(A) The Division shall provide a copy of the permit application (including the compliance plan) directly to the EPA, or the Division may require that the applicant requiring a permit under this section submit a copy of the application directly to the EPA.

(B) The Division shall provide to the Administrator of the EPA a copy of each proposed permit and each final operating permit.

(C) The Division shall keep all records associated with applications and permits under this section for a period of five years.

(ii) Review by Affected States.

(A) The Division shall give notice of each draft permit to any affected State at the time notice is provided to the public under Chapter 6, Section 3(d)(ix), except to the extent Chapter 6, Section 3(d)(vi)(A) allows the time of the notice to be different for minor permit modification procedures.

(B) The Division, as part of the submittal of the proposed permit to the EPA, or for a minor permit modification procedure, as soon thereafter as possible, shall notify the EPA and any affected State in writing of any refusal to accept all recommendations for the proposed permit that the affected State submitted during the public comment period. The notice shall include the Division's reasons for not accepting any such recommendation. The Division is not required to accept recommendations that are not based on applicable requirements or the requirements of this section.

(iii) EPA Objection.

(A) No permit shall be issued if the Administrator of the EPA objects to its issuance in writing within 45 days of receipt of the proposed permit and all necessary supporting information.

(B) Any EPA objection under Chapter 6, Section 3(e)(ii)(C) shall include a statement of reasons for the objection and a description of the terms and conditions that the permit must include to respond to the objections. The EPA shall provide the permit applicant with a copy of the objection.

(C) Failure of the Division to do any of the following shall also constitute grounds for an objection:

(I) Comply with Chapter 6, Sections 3(e)(i)(A) and (B), and Chapter 6, Sections 3(e)(ii)(A) and (B);

(II) Submit any information necessary to adequately review the proposed permit; or

(III) Process the permit under the procedures approved to meet the public participation requirements of Chapter 6, Section 3(d)(ix) except for minor permit modifications.

(D) If the Division fails, within ninety (90) days after the date of an objection under Chapter 6, Section 3(e)(ii)(C), to revise and submit a proposed permit in response to the objection, the EPA will issue or deny the permit in accordance with the requirements of the federal program promulgated under Title V of the Act.

(iv) Public Petitions to the EPA. If the EPA does not object in writing under paragraph (C) of this subsection, any person may petition the EPA within 60 days after the expiration of the 45-day review period to make such an objection. Any such petition shall be based only on objections to the permit that were raised with reasonable specificity during the public comment period provided for in Chapter 6, Section 3(d)(ix), unless the petitioner demonstrates that it was impracticable to raise such objections within such period, or unless the grounds for such objection arose after such period. If the EPA objects to the permit as a result of a petition filed under this paragraph, the Division shall not issue the permit until the EPA's objection has been resolved, except that a petition for review does not stay the effectiveness of a permit or its requirements if the permit was issued after the end of the 45-day review period and prior to the EPA objection. If a permit has been issued, the Division may thereafter issue only a revised permit that satisfies the EPA objection. In any case, the source will not be in violation of the requirement to have submitted a timely and complete application.

(v) No operating permit (including a permit renewal or revision) will be issued until affected States and EPA have had an opportunity to review the proposed permit as required under this section.

(f) Fees.

(i) Fee Requirement. Any source required to obtain a permit under this section shall, as a condition of continued operation, submit an annual fee to the Department.

(ii) Fee Payment. The Department shall give written notice of the amount of fee to be assessed and the basis for such fee assessment to the owner or operator of the source annually. The assessed fee is due on receipt of the notice unless the fee assessment is appealed pursuant to W.S. § 35-11-211(d). If any part of the fee assessment is not appealed it shall be paid to the Department on receipt of the written notice. Any remaining fee which may be due after completion of the appeal is immediately due and payable upon issuance of the council's decision.

(iii) Basis of Fee to Support the Program.

(A) Fees shall be assessed annually for each operating source, based on emissions of each regulated pollutant in an amount sufficient to cover all reasonable direct and indirect costs of the Department in developing, implementing and administering the operating permit program of this section, including the Department's Small Business Assistance Program. The permit fee will cover all reasonable direct and indirect program costs including cost of:

(I) Reviewing and acting on permit applications, permit renewals, permit reopenings, and permit revisions;

(II) Implementing and enforcing the terms and conditions of a permit (not including any court costs or other costs associated with any enforcement action) which include but is not limited to the following:

- (1.) Source inspections including the witnessing and review of stack emission tests;
- (2.) Ambient monitoring data review and reporting;
- (3.) Continuous emission monitoring (CEM) reports and data review;
- (4.) Complaint investigations;
- (5.) Special purpose monitoring;
- (6.) Ambient and CEM systems audits;
- (7.) EPA reporting and data entry;

- (III) Emissions and ambient monitoring;
- (IV) Regulation preparation and guidance;
- (V) Modeling analyses and demonstrations;
- (VI) Preparing emission and source inventories and tracking emissions;
- (VII) Fee assessment, billing and fiscal management;
- (VIII) All other permit related functions performed by the Department;
- (IX) Development and administration of Department Small Business Assistance Program; and
- (X) Informational management activities.

(B) Exclusions.

(I) No fee will be assessed for emissions of a regulated pollutant in excess of 4000 tons per year at a source.

(II) For purposes of fee assessment, only under this section, the term “regulated pollutant” shall not include carbon monoxide, asbestos as regulated in Chapter 3, Section 8 of the WAQSR, residential wood smoke as regulated under Chapter 5, Section 2, Subpart AAA, or any substance which would be regulated only because it is listed or regulated under section 112(r) of the Act, prevention of accidental releases for hazardous air pollutants.

(III) Fugitive emissions of total suspended particulate matter (TSP) emissions, provided however, that portion of TSP which is PM₁₀ particulate matter will be estimated and assessed fees.

(iv) Fee Determination.

(A) Fees for individual sources shall be computed by multiplying the total annual emissions, in tons up to a maximum of 4000 tons per year of each regulated pollutant emitted by the source, by the dollar per ton fee calculated as follows:

$$x = F \div T$$

Where: x = dollars per ton of emissions for each regulated pollutant emitted.

F = total annual fee target.

T = total number of tons state-wide of all regulated pollutants listed in the most recent annual emissions inventory for all sources subject to this section.

(B) Annual Fee Target. The annual fee target shall be computed as follows:

$$\text{Annual fee target (F)} = (LA - \text{NSR}) \div 2$$

Where: LA = The amount of funds appropriated from the permit fee fund by the legislature for the operation and implementation of the construction and modification permit programs and the operating permit program for a two-year period. This appropriation includes any carry over in the fund from previous budget periods.

NSR = Projected costs of reviewing and issuing construction and modification permits under the Division's new source review program pursuant to Chapter 6, Sections 2 and 4 of the WAQSR for the two-year budget period.

(C) Individual source fees shall be the greater of fees calculated pursuant to Chapter 6, Section 3(f)(iv)(A) or \$500.00.

(D) A fee of \$250.00 shall be required for the operation of a temporary source at each new location.

(E) Any affected unit which is utilized in an EPA approved Phase I substitution plan under section 404 of the Act during the years of 1995-1999 (inclusive) shall be subject to an annual fee of \$35,000, in lieu of a fee based on actual emissions under Chapter 6, Section 3(d)(v), for each year that it participates in such a substitution plan for the purpose of covering the portion of direct and indirect costs described in Chapter 6, Section 3(d)(iii)(A) attributed to administering the program for those affected units.

(v) Fees Shall Be Based on Actual Emissions.

(A) Actual emissions for purposes of assessing fees are, in order of decreasing accuracy:

(I) Emission measured by a continuous emissions monitoring system (CEMS) that converts pollutant concentrations to mass emission rates and that meets the requirements for CEMS installation, operation, and certification of the WAQSR or any regulation promulgated by EPA under the Act. Actual emissions are the total emissions measured by the CEMS for the year plus estimated emissions during times when the CEMS was not operational.

(II) Emissions measured by periodic stack emission tests which have been accepted by the Division as being representative of normal source operation. Actual emissions are the hourly emission rates multiplied by the annual hours of operation.

(III) Emissions estimated by the utilization of data from the manufacturer of an internal combustion engine or turbine. Actual emissions are the hourly emission rates multiplied by the annual hours of operation.

(IV) Emissions estimated by utilization of the EPA document AP-42, "Compilation of Air Pollutant Emission Factors", or Division approved source-specific emission factors. Actual emissions are the hourly emission rates multiplied by the annual hours of operation.

(B) The methodology selected for the determination of actual emissions for fee assessment by the Division shall be equivalent to methods specified in any Chapter 6, Section 2 permit that the source may hold for initial applications applied for under this section, or emissions as verified by methods prescribed in a permit issued under this section. Actual emissions for sources for which no permit has previously been issued or for which no method has been prescribed in the permit shall be determined by the Division utilizing the most accurate method available as enumerated above under Chapter 6, Section 3(f)(v)(A).

(C) Actual emissions may, at the source's choice, be presumed to be allowable emissions as determined by applicable requirements (standards and regulations) or by permit unless there is evidence that actual emissions are in excess of allowable emissions.

(D) Particulate Emissions: Until such time as continuous measurement of particulate mass emission rates from stacks becomes available or required, particulate mass emission rates for purposes of fee assessment will be based on allowable emission rates.

(E) Fugitive emission rates, for purposes of fee assessment, will be determined by EPA AP-42 emission factors, or by Division approved emission factors, in the case of emissions from surface coal mines and other similar sources of fugitive dust emissions. The use of alternative emission factors which are source specific must be well documented and approved for use by the Division prior to the date on which emission inventories are due to be submitted to the Division.

(F) Emissions in excess of applicable requirements or permit limits due to equipment malfunction and/or failure, or process start-up and shutdowns, to the extent that such emissions are quantifiable through recognized engineering calculations or emissions and process monitoring, shall be included in source emission inventories and assessed a fee.

(G) Fees shall be assessed against owners or operators of sources applying for any permit under this section and annually thereafter for the duration of the permit. Emission inventories for sources subject to this section shall be submitted to the Division for fee assessment and compliance determinations within sixty (60) days following the end of the calendar year.

(I) During the initial year of the operating permit program, sources required to apply for a permit under this section shall be assessed fees which include operations for the calendar year 1994.

(II) Fees shall be based on calendar year source operations.

(III) New sources applying for initial permits under this section shall pay a fee based on emissions occurring since the commencement of operation for the previous calendar year and annually thereafter.

(vi) Failure to Pay Fees. Failure to pay fees owned the Department is a violation of this section and W.S. § 35-11-203 and may be cause for the revocation of any permit issued to the source.

(g) Small Business Assistance Program.

(i) Any source operated or owned by a business which qualifies as a small business under the Department **Small Business Assistance Program** may apply for assistance in complying with the requirements of this section.

(h) Permit Content.

(i) Standard Permit Requirements. Each permit issued under this section shall include the following elements:

(A) Emission limitations and standards, including those operational requirements and limitations that are applied to assure compliance with all applicable requirements at the time of permit issuance.

(I) The permit shall specify and reference the origin of and authority for each term of condition, and identify any difference in form as compared to the applicable requirement upon which the term or condition is based.

(II) The permit shall state that, where an applicable requirement of the Act is more stringent than any applicable requirement of regulations promulgated under Title IV of the Act, both provisions shall be incorporated into the permit and shall be enforceable by the EPA and the Division.

(III) In addition to the requirements in Chapter 6, Section 3(h)(i)(A)(I) and (II), the permit shall include emission limitations and standards which are a part of the WAQSR and are more stringent than those of any requirements of the Act. However, such requirements shall not be federally enforceable.

(B) Permit Duration. The Division shall issue permits for a fixed term of five years for all sources except in such circumstances as provided in W.S. § 35-11-206(f)(i), where a permit may be issued for a shorter term.

(C) Monitoring and Related Recordkeeping and Reporting Requirements.

(I) Each permit shall contain the following requirements with respect to monitoring:

(1.) All emissions monitoring and analysis procedures or test methods required under the applicable monitoring and testing requirements, including any procedures and methods promulgated pursuant to Title IV and sections 504(b) or 114(a)(3) of the Act. If more than one monitoring or testing requirement applies, the permit may specify a streamlined set of monitoring or testing provisions provided the specified monitoring or testing is adequate to assure compliance at least to the same extent as the monitoring or testing applicable requirements that are not included in the permit as the result of such streamlining;

(2.) Where the applicable requirement does not require periodic testing or instrumental or noninstrumental monitoring (which may consist of recordkeeping designed to serve as monitoring), periodic monitoring sufficient to yield reliable data from the relevant time period that are representative of the source's compliance with the permit, as reported pursuant to Chapter 6, Section 3(h)(i)(C)(III). Such monitoring requirements shall assure use of terms, test methods, units, averaging periods, and other statistical conventions consistent with the applicable requirement.

Recordkeeping provisions may be sufficient to meet the requirements of this paragraph;
and

(3.) As necessary, requirements concerning the use, maintenance, and, when appropriate, installation of monitoring equipment or methods.

(II) With respect to recordkeeping, the permit shall incorporate all applicable recordkeeping requirements and require, where applicable, the following:

(1.) Records of monitoring information that include the following:

- a. The date, place as defined in the permit, and time of sampling or measurements;
- b. The date(s) the analyses were performed;
- c. The company or entity that performed the analyses;
- d. The analytical techniques or methods used;
- e. The results of such analyses; and
- f. The operating conditions as they existed at the time of sampling or measurement.

(2.) Retention of records of all monitoring data and support information for a period of at least five years from the date of the monitoring sample, measurement, report, or application. Support information includes all calibration and maintenance records and all original strip-chart recordings for continuous monitoring instrumentation, and copies of all reports required by the permit.

(III) With respect to reporting, the permit shall incorporate all applicable reporting requirements and require the following:

(1.) Submittal of Reports of Any Required Monitoring at Least Every Six Months. All instances of deviations from permit requirements must be clearly identified in such reports. All required reports must be certified by a responsible official consistent with Chapter 6, Section 3(c)(iv).

(2.) Prompt reporting of deviations from permit requirements, including those attributable to upset conditions as defined in the permit, the probable cause of such deviations, and any corrective actions or preventive measures taken. The Division shall define “prompt” in relation to the degree and type of deviation likely to occur and the applicable requirements.

(IV) To meet the requirements of Title IV of the Act, for affected sources under the acid rain program, the permit shall incorporate all provisions for monitoring, recordkeeping, and reporting promulgated in 40 CFR part 75.

(D) A permit condition prohibiting emissions exceeding any allowances that the source lawfully holds under Title IV of the Act or the regulations promulgated thereunder.

(I) No permit revision shall be required for increases in emissions that are authorized by allowances acquired pursuant to the acid rain program, provided that such increases do not require a permit revision under any other applicable requirement.

(II) No limit shall be placed on the number of allowances held by the source. The source may not, however, use allowances as a defense for noncompliance with any other applicable requirement.

(III) Any such allowance shall be accounted for according to the procedures established in regulations promulgated under Title IV of the Act.

(E) A severability clause to ensure the continued validity of the various permit requirements in the event of a challenge to any portion(s) of the permit.

(F) Provisions Stating the Following:

(I) Duty to Comply. The permittee must comply with all conditions of the operating permit. Any permit noncompliance constitutes a violation of the Act, Article 2 of the Wyoming Environmental Quality Act and the WAQSR and is grounds for enforcement action; for permit termination, revocation and reissuance, or modification; or for denial of a permit renewal application.

(II) Need to Halt or Reduce Activity is Not a Defense. It shall not be a defense for a permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of the permit.

(III) Permit Actions. The permit may be modified, revoked, reopened, and reissued, or terminated for cause. The filing of a request by the

permittee for a permit modification, revocation and reissuance, or termination, or of a notification of planned changes or anticipated noncompliance does not stay any permit condition.

(IV) Property Rights. The permit does not convey any property rights of any sort, or any exclusive privilege.

(V) Duty to Provide Information. The permittee shall furnish to the Division, within a reasonable time, any information that the Division may request in writing to determine whether cause exists for modifying, revoking and reissuing, or terminating the permit or to determine compliance with the permit. Upon request, the permittee shall also furnish to the Division copies of records required to be kept by the permit, including information claimed and shown to be confidential under Section 35-11-1101(a) of the Wyoming Environmental Quality Act. Upon request by the Division, the permittee shall also furnish confidential information directly to EPA along with a claim of confidentiality.

(G) A provision to ensure that any source under this section pays fees to the Division consistent with Chapter 6, Section 3(f) and the fee schedule developed by the Division and approved by the joint appropriations committee of the Wyoming State Legislature.

(H) Emissions Trading. A provision stating that no permit revision shall be required, under any approved economic incentives, marketable permits, emissions trading and other similar programs or processes for changes that are provided for in the permit.

(I) Terms and conditions for reasonably anticipated operating scenarios identified by the source in its application as approved by the Division. Such terms and conditions:

(I) Shall require the source, contemporaneously with making a change from one operating scenario to another, to record in a log at the permitted source a record of the scenario under which it is operating;

(II) May extend the permit shield described in Chapter 6, Section 3(k) to all terms and conditions under each such operating scenario; and

(III) Must ensure that the terms and conditions of each such alternative scenario meet all applicable requirements and the requirements of this section.

(J) Terms and conditions, if the permit applicant requests them, for the trading of emissions increases and decreases in the permitted source, to the extent that

the applicable requirements, including the State implementation plan, provide for trading such increases and decreases without a case-by-case approval of each emissions trade. Such terms and conditions:

(I) Shall include all terms required under Chapter 6, Section 3(h)(i) and (iii) to determine compliance;

(II) May extend the permit shield described in Chapter 6, Section 3(k) to all terms and conditions that allow such increases and decreases in emissions; and

(III) Must meet all applicable requirements and requirements of this section.

(ii) Federally-Enforceable Requirements.

(A) All terms and conditions in an operating permit under this section, including any provisions designed to limit a source's potential to emit, are enforceable by the EPA and citizens under the Act.

(B) Notwithstanding paragraph (A) above, the Division shall specifically designate as not being federally enforceable under the Act any terms and conditions included in the permit that are not required under the Act or any regulations promulgated thereunder.

(iii) Compliance Requirements. All operating permits under this section shall contain the following elements with respect to compliance:

(A) Consistent with Chapter 6, Section 3(h)(i)(C), compliance certification, testing, monitoring, reporting, and recordkeeping requirements sufficient to assure compliance with the terms and conditions of the permit. Any document (including reports) required by an operating permit under this section shall contain a certification by a responsible official that meets the requirements of Chapter 6, Section 3(c)(iv).

(B) Inspection and entry requirements that require that, upon presentation of credentials and other documents as may be required by law, the permittee shall allow the Division or an authorized representative to perform the following:

(I) Enter upon the permittee's premises where a source is located or emissions related activity is conducted, or where records must be kept under the conditions of the permit.

(II) Have access to and copy, at reasonable times, any records that must be kept under the conditions of the permit.

(III) Inspect at reasonable times any facilities, equipment (including monitoring and air pollution control equipment), practices, or operations regulated or required under the permit.

(IV) As authorized by the Act, sample or monitor, at reasonable times, any substances or parameters for the purpose of assuring compliance with the permit or applicable requirements.

(C) A schedule of compliance consistent with Chapter 6, Section 3(c)(ii)(A)(VIII).

(D) Progress reports consistent with an applicable schedule of compliance and Chapter 6, Section 3(c)(ii)(A)(VIII) to be submitted at least semiannually, or at a more frequent period if specified in the applicable requirement or by the Division. Such progress reports shall contain the following:

(I) Dates for achieving the activities, milestones, or compliance required in the schedule of compliance, and dates when such activities, milestones or compliance were achieved; and

(II) An explanation of why any dates in the schedule of compliance were not or will not be met, and any preventive or corrective measures adopted.

(E) Requirements for compliance certification with terms and conditions contained in the permit, including emission limitations, standards, or work practices. Permits shall include each of the following:

(I) The frequency (not less than annually or such more frequent period as specified in the applicable requirement or by the Division) of submissions of compliance certifications;

(II) A means for assessing or monitoring the compliance of the source with its emissions limitations, standards, and work practices;

(III) A requirement that the compliance certification include the following (provided that the identification of applicable information may cross-reference the permit or previous reports as applicable):

(1.) The identification of each term or condition of the permit that is the basis of the certification;

(2.) The status of compliance with the terms and conditions of the permit for the period covered by the certification, based on the method

or means designated in Chapter 6, Section 3(h)(iii)(E)(III)(4.). The certification shall identify each deviation and take it into account in the compliance certification. The certification shall also identify as possible exceptions to compliance any periods during which compliance is required and in which an excursion or exceedance as defined in Chapter 7, Section 3 occurred;

(3.) Whether compliance was continuous or intermittent;

(4.) The identification of the method(s) or other means used by the owner or operator for determining the compliance status with each term and condition during the certification period, and whether such methods or other means provide continuous or intermittent data. Such methods and other means shall include, at a minimum, the methods and means required under Chapter 6, Section 3(h)(i)(C). If necessary, the owner or operator also shall identify any other material information that must be included in the certification to comply with section 113(c)2 of the Clean Air Act, which prohibits knowingly making a false certification or omitting material information;

(5.) Such other facts as the Division may require to determine the status of the source;

(IV) A requirement that all compliance certifications be submitted to the EPA as well as to the Division.

(F) Such other provisions as the Division may require.

(i) General Permits.

(i) Issuance. The Division may, after notice and opportunity for public comment and hearing pursuant to Chapter 6, Section 3(d)(ix), issue a general permit covering numerous similar sources. Any general permit shall comply with all requirements applicable to other operating permits under this section and shall identify criteria by which sources may qualify for the general permit. To sources that qualify, the Division shall grant the conditions and terms of the general permit. Notwithstanding the shield provisions of Chapter 6, Section 3(k), the source shall be subject to enforcement action for operation without an operating permit under this section if the source is later determined not to qualify for the conditions and terms of the general permit. General permits shall not be authorized for affected sources under the acid rain program unless otherwise provided in regulations promulgated under Title IV of the Act.

(ii) Application. Sources under this section that would qualify for a general permit must apply to the Division for coverage under the terms of the general permit or must apply for an operating permit consistent with Chapter 6, Section 3(c). The

Division may provide for general permit applications which deviate from the requirements of Chapter 6, Section 3(c) provided that such applications meet the requirements of Title V of the Act and include all information necessary to determine qualification for, and to assure compliance with, the general permit. The Division may grant a source's request for authorization to operate under a general permit without repeating the notice and comment procedures required under Chapter 6, Section 3(d)(ix), but such issuance shall not be a final action for purposes of judicial review.

(j) Temporary Sources (Portable Sources). The Division may issue a single permit authorizing emissions from similar operations by the same source owner or operator at multiple temporary locations. The operations must be temporary and involve at least one change of location during the term of the permit. No affected source shall be permitted as a temporary source. Permits for temporary sources shall include the following:

(i) Conditions that will assure compliance with all applicable requirements at all authorized locations;

(ii) Requirements that the owner or operator notify the Division at least ten days in advance of each change in location; and

(iii) Conditions that assure compliance with all other provisions of this section.

(k) Permit Shield.

(i) Except as provided in this part, the Division may expressly include in an operating permit under this section a provision stating that compliance with the conditions of the permit shall be deemed compliance with any applicable requirements as of the date of permit issuance, provided that:

(A) Such applicable requirements are included and are specifically identified in the permit; or

(B) The Division, in acting on the permit application or revision, determines in writing that other requirements specifically identified are not applicable to the source, and the permit includes the determination or a concise summary thereof.

(ii) An operating permit under this section that does not expressly state that a permit shield exists shall be presumed not to provide such a shield.

(iii) Nothing in this paragraph or in any operating permit under this section shall alter or affect the following:

(A) The provisions of section 303 of the Act (emergency orders), including the authority of the EPA under that section.

(B) The liability of an owner or operator of a source for any violation of applicable requirements prior to or at the time of permit issuance.

(C) The applicable requirements of the acid rain program, consistent with section 408(a) of the Act.

(D) The ability of the EPA to obtain information from a source pursuant to section 114 of the Act, or the Division to obtain information pursuant to Section 35-11-110 of the Wyoming Environmental Quality Act.

(l) Emergency Provision.

(i) Definition. An “emergency” means any situation arising from sudden and reasonably unforeseeable events beyond the control of the source, including acts of God, which situation requires immediate corrective action to restore normal operation, and that causes the source to exceed a technology-based emission limitation under the permit, due to unavoidable increases in emissions attributable to the emergency. An emergency shall not include noncompliance to the extent caused by improperly designed equipment, lack of preventative maintenance, careless or improper operation, or operator error.

(ii) Effect of an Emergency. An emergency constitutes an affirmative defense to an action brought for noncompliance with such technology-based emission limitations if the conditions of the following paragraph (l)(iii) are met.

(iii) Affirmative Defense. The affirmative defense of emergency shall be demonstrated through properly signed, contemporaneous operating logs, or other relevant evidence that:

(A) An emergency occurred and that the permittee can identify the cause(s) of the emergency;

(B) The permitted source was at the time being properly operated;

(C) During the period of the emergency the permittee took all reasonable steps to minimize levels of emissions that exceeded the emission standards, or other requirements in the permit; and

(D) The permittee submitted notice of the emergency to the Division within one working day of the time when emission limitations were exceeded due to the emergency. This notice fulfills the requirement of Chapter 6, Section

3(h)(i)(C)(III)(2.). This notice must contain a description of the emergency, any steps taken to mitigate emissions, and corrective actions taken.

(iv) Enforcement. In any enforcement proceeding, the permittee seeking to establish the occurrence of an emergency has the burden of proof.

(v) Scope. This provision is in addition to any emergency or upset provision contained in any applicable requirement.

(m) Permits for Synthetic Minors.

(i) Applicability. A source may apply under this section for a permit or for a condition to a permit to limit emissions below any threshold level which would otherwise subject the source to an applicable requirement or to the provisions of this section utilizing the source's potential to emit. With respect to a condition or permit so issued, the source will not have to comply with the other provisions of this section with the exception of the following:

(A) The payment of a fee based on tons of emissions emitted pursuant to the fee schedule developed under Chapter 6, Section 3(f);

(B) The emissions limit specified in the permit shall be federally enforceable and enforceable by the Division; and

(C) Compliance with any applicable requirements specified in the permit or elsewhere in the WAQSR.

(ii) Use of General Permits. General permits issued in accordance with Chapter 6, Section 3(i) may be utilized by the Division to permit numerous similar synthetic minor sources.

(iii) Use of Chapter 6, Section 2 Permit. A source may apply for a permit under Chapter 6, Section 2 of the WAQSR to qualify as a synthetic minor, provided the permit is federally enforceable.

Section 4. **Prevention of significant deterioration.**

(a) Definitions. For purposes of this section:

“Actual emissions” means the actual rate of emissions of a regulated NSR pollutant from an emissions unit, as determined in accordance with paragraphs (i) through (iii) of this definition, except that this definition shall not apply for calculating whether a significant emissions increase has occurred, or for establishing a PAL under paragraph

(b)(xv) of this section. Instead, the definitions for “Projected actual emissions” and “Baseline actual emissions” of this section shall apply for those purposes.

(i) In general, actual emissions as of a particular date shall equal the average rate, in tons per year, at which the unit actually emitted the pollutant during a consecutive 24-month period which precedes the particular date and which is representative of normal source operation. The Division shall allow the use of a different time period upon a determination that it is more representative of normal source operation. Actual emissions shall be calculated using the unit’s actual operating hours, production rates, and types of materials processed, stored, or combusted during the selected time period.

(ii) The Division may presume that source-specific allowable emissions for the unit are equivalent to the actual emissions of the unit.

(iii) For any emissions unit that has not begun normal operations on the particular date, actual emissions shall equal the potential to emit of the unit on that date.

“Administrator” means Administrator of the Division of Air Quality, Wyoming Department of Environmental Quality.

“Allowable emissions” means the emission rate of a stationary source calculated using the maximum rated capacity of the source (unless the source is subject to enforceable permit conditions which limit the operating rate or hours of operation, or both) and the most stringent of the following:

(i) Applicable standards set forth in Chapter 5, Section 2 or Section 3 of these regulations and other new source performance standards and national emission standards for hazardous air pollutants promulgated by the EPA but not yet adopted by the State of Wyoming.

(ii) Any other applicable emission limit in these regulations.

(iii) The emission rate agreed to by the owner or operator as an enforceable permit condition.

“Baseline actual emissions” means the rate of emissions, in tons per year, of a regulated NSR pollutant, as determined in accordance with paragraphs (i) through (iv) of this definition.

(i) For any existing electric utility steam generating unit, baseline actual emissions means the average rate, in tons per year, at which the unit actually emitted the pollutant during any consecutive 24-month period selected by the owner or operator within the 5-year period immediately preceding when the owner or operator begins actual

construction of the project. The Division shall allow the use of a different time period upon a determination that it is more representative of normal source operation.

(A) The average rate shall include fugitive emissions to the extent quantifiable, and emissions associated with startups, shutdowns, and malfunctions.

(B) The average rate shall be adjusted downward to exclude any non-compliant emissions that occurred while the source was operating above an emission limitation that was legally enforceable during the consecutive 24-month period.

(C) For a regulated NSR pollutant, when a project involves multiple emissions units, only one consecutive 24-month period must be used to determine the baseline actual emissions for the emissions units being changed. A different consecutive 24-month period can be used for each regulated NSR pollutant.

(D) The average rate shall not be based on any consecutive 24-month period for which there is inadequate information for determining annual emissions, in tons per year, and for adjusting this amount if required by paragraph (i)(B) of this definition.

(ii) For an existing emissions unit (other than an electric utility steam generating unit), baseline actual emissions means the average rate, in tons per year, at which the emissions unit actually emitted the pollutant during any consecutive 24-month period selected by the owner or operator within the 10-year period immediately preceding either the date the owner or operator begins actual construction of the project, or the date a complete permit application is received by the Division for a Chapter 6, Section 4 permit, whichever is earlier, except that the 10-year period shall not include any period earlier than November 15, 1990.

(A) The average rate shall include fugitive emissions to the extent quantifiable, and emissions associated with startups, shutdowns, and malfunctions.

(B) The average rate shall be adjusted downward to exclude any non-compliant emissions that occurred while the source was operating above an emission limitation that was legally enforceable during the consecutive 24-month period.

(C) The average rate shall be adjusted downward to exclude any emissions that would have exceeded an emission limitation with which the major stationary source must currently comply, had such major stationary source been required to comply with such limitations during the consecutive 24-month period; however, if an emission limitation is part of a maximum achievable control technology standard that the EPA Administrator proposed or promulgated under 40 CFR 63, the baseline actual emissions need only be adjusted if the Division has taken credit for such emissions

reductions in an attainment demonstration or maintenance plan consistent with the requirements of 40 CFR 51.165(a)(3)(ii)(G).

(D) For a regulated NSR pollutant, when a project involves multiple emissions units, only one consecutive 24-month period must be used to determine the baseline actual emissions for the emissions units being changed. A different consecutive 24-month period can be used for each regulated NSR pollutant.

(E) The average rate shall not be based on any consecutive 24-month period for which there is inadequate information for determining annual emissions, in tons per year, and for adjusting this amount if required by paragraphs (ii)(B) and (C) of this definition.

(iii) For a new emissions unit, the baseline actual emissions for purposes of determining the emissions increase that will result from the initial construction and operation of such unit shall equal zero; and thereafter, for all other purposes, shall equal the unit's potential to emit.

(iv) For a PAL for a stationary source, the baseline actual emissions shall be calculated for existing electric utility steam generating units in accordance with the procedures contained in paragraph (i) of this definition, for other existing emissions units in accordance with the procedures contained in paragraph (ii) of this definition, and for a new emissions unit in accordance with the procedures contained in paragraph (iii) of this definition.

“Baseline area” means any intrastate area (and every part thereof) designated as attainment or unclassifiable under the Federal Clean Air Act in which a major source or major modification establishing the minor source baseline date would construct or would have an air quality impact equal to or greater than $1 \mu\text{g}/\text{m}^3$ (annual average) of the pollutant for which the minor source baseline date is established.

(i) The following baseline areas have been designated as separate particulate matter attainment areas under section 107 of the Clean Air Act:

(A) The Powder River Basin Area, described as that area bounded by Township 40 through 52 North, and Range 69 through 73 West, inclusive of the Sixth Principal Meridian, Campbell and Converse Counties, excluding the areas defined as the Pacific Power and Light attainment area and the Hampshire Energy attainment area.

(B) The Pacific Power and Light Area, described as that area bounded by the NW¹/₄ of Section 27, T50N, R71W, Campbell County, Wyoming.

(C) The Hampshire Energy Area, described as that area bounded by Section 6 excluding the SW¹/₄; E¹/₂ Section 7; Section 17 excluding the SW¹/₄; Section

14 excluding the SE $\frac{1}{4}$; Sections 2, 3, 4, 5, 8, 9, 10, 11, 15, 16 of T48N, R70W and Section 26 excluding the NE $\frac{1}{4}$; SW $\frac{1}{4}$ Section 23; Sections 19, 20, 21, 22, 27, 28, 29, 30, 31, 32, 33, 34, 35 of T49N, R70W, Campbell County, Wyoming.

(D) The Kennecott-Puron Area, described as the area bounded by the W $\frac{1}{2}$ SW $\frac{1}{4}$ Section 18, W $\frac{1}{2}$ NW $\frac{1}{4}$, NW $\frac{1}{4}$ SW $\frac{1}{4}$ Section 19, T47N, R70W, S $\frac{1}{2}$ Section 13, N $\frac{1}{2}$, N $\frac{1}{2}$ SW $\frac{1}{4}$, N $\frac{1}{2}$ SE $\frac{1}{4}$ Section 24 T47N, R71W, Campbell County, Wyoming.

(E) The remainder of the State of Wyoming.

(ii) Any baseline area established originally for the TSP increments shall remain in effect and shall apply for purposes of determining the amount of available PM₁₀ increments.

“Baseline concentration” means that ambient concentration level which exists in the baseline area at the time of the applicable minor source baseline date. A baseline concentration is determined for each pollutant for which a minor source baseline date is established and shall include:

(i) The actual emissions, as defined in this section, representative of sources in existence on the applicable minor source baseline date, except as provided in paragraph (iv) of this definition;

(ii) The allowable emissions of major stationary sources which commenced construction before the major source baseline date, but were not in operation by the applicable minor source baseline date;

(iii) Contributions due to emissions from any emitting source or modification which (1) is not listed in Chapter 6, Section 4(a) under the definition for “Major stationary source”, item (a) and qualified as “major” prior to August 7, 1980 only because fugitive emissions were included in determining potential to emit, (2) submitted a complete permit application under Chapter 6, Section 4(b) or the Federal Clean Air Act prior to August 7, 1980, and (3) was in existence as of the minor source baseline date;

(iv) The following will not be included in the baseline concentration and will affect the applicable maximum allowable increment:

(A) Actual emissions, as defined in this section, from any major stationary source on which construction commenced after the major source baseline date; and

(B) Actual emissions increases and decreases, as determined in accordance with the definition for “Actual emissions” in this section, at any stationary source occurring after the minor source baseline date.

“Begin actual construction” means, in general, initiation of physical on-site construction activities on an emissions unit which are of a permanent nature. Such activities include, but are not limited to, installation of building supports and foundations, laying of underground pipework, and construction of permanent storage structures. With respect to a change in method of operation this term refers to those onsite activities, other than preparatory activities, which mark the initiation of the change.

“Best available control technology” means an emission limitation (including a visible emission standard) based on the maximum degree of reduction of each pollutant subject to regulation under these Standards and Regulations or regulation under the Federal Clean Air Act, which would be emitted from or which results for any proposed major stationary source or major modification which the Administrator, on a case-by-case basis, taking into account energy, environmental, and economic impacts and other costs, determines is achievable for such source or modification through application or production processes and available methods, systems, and techniques, including fuel cleaning or treatment or innovative fuel combustion techniques for control of such pollutant. If the Administrator determines that technological or economic limitations on the application of measurement methodology to a particular emissions unit would make the imposition of an emission standard infeasible, he may instead prescribe a design, equipment, work practice or operational standard or combination thereof to satisfy the requirement of Best Available Control Technology. Such standard shall, to the degree possible, set forth the emission reduction achievable by implementation of such design, equipment, work practice, or operation and shall provide for compliance by means which achieve equivalent results. Application of BACT shall not result in emissions in excess of those allowed under Chapter 5, Section 2 or Section 3 of these regulations and any other new source performance standard or national emission standards for hazardous air pollutants promulgated by the EPA but not yet adopted by the State of Wyoming.

“Clean coal technology” means any technology, including technologies applied at the precombustion, combustion, or post combustion stage, at a new or existing facility which will achieve significant reduction in air emissions of sulfur dioxide or oxides of nitrogen associated with the utilization of coal in the generation of electricity, or process steam which was not in widespread use as of November 15, 1990.

“Clean coal technology demonstration project” means a project using funds appropriated under the heading “Department of Energy-Clean Coal Technology”, up to a total amount of \$2,500,000,000 for commercial demonstration of clean coal technology, or similar projects funded through appropriations for the Environmental Protection Agency. The Federal contribution for a qualifying project shall be at least 20 percent of the total cost of the demonstration project.

“Commenced”, as applied to construction of a major stationary source or major modification, means that the owner or operator has obtained a Construction Permit required by Chapter 6, Section 2 and either has (i) begun, or caused to begin, a continuous

program of actual on-site construction of the source or (ii) entered into binding agreements or contractual obligations, which cannot be canceled or modified without substantial loss to the owner or operator, to undertake a program of construction of the source to be completed within a reasonable time.

“Complete” means, in reference to an application for a permit, that the application contains all the information necessary for processing the application. Designating an application complete for purposes of permit processing does not preclude the Division from requesting or accepting any additional information.

“Construction” means any physical change or change in the method of operation (including fabrication, erection, installation, demolition, or modification of an emissions unit) which would result in a change in emissions.

“Continuous emissions monitoring system (CEMS)” means all of the equipment that may be required to meet the data acquisition and availability requirements of this section, to sample, condition (if applicable), analyze, and provide a record of emissions on a continuous basis.

“Continuous emissions rate monitoring system (CERMS)” means the total equipment required for the determination and recording of the pollutant mass emissions rate (in terms of mass per unit of time).

“Continuous parameter monitoring system (CPMS)” means all of the equipment necessary to meet the data acquisition and availability requirements of this section, to monitor process and control device operational parameters (for example, control device secondary voltages and electric currents) and other information (for example, gas flow rate, O₂ or CO₂ concentrations), and to record average operational parameter value(s) on a continuous basis.

“Electric utility steam generating unit” means any steam electric generating unit that is constructed for the purpose of supplying more than one-third of its potential electric output capacity and more than 25 MW electrical output to any utility power distribution system for sale. Any steam supplied to a steam distribution system for the purpose of providing steam to a steam-electric utility steam generator that would produce electrical energy for sale is also considered in determining the electrical energy output capacity of the affected facility.

“Emissions unit” means any part of a stationary source that emits or would have the potential to emit any regulated NSR pollutant and includes an electric utility steam generating unit as defined in this section. For purposes of this section, there are two types of emissions units as described in paragraphs (i) and (ii) of this definition.

(i) A new emissions unit is any emissions unit that is (or will be) newly constructed and that has existed for less than 2 years from the date such emissions unit first operated.

(ii) An existing emissions unit is any emissions unit that does not meet the requirements in paragraph (i) of this definition.

“Enforceable” means all limitations and conditions which are enforceable under provisions of the Wyoming Environmental Quality Act and/or are federally enforceable by the Administrator of the EPA, including those requirements developed pursuant to 40 CFR parts 60 and 61, requirements within the State Implementation Plan, and any permit requirements established pursuant to 40 CFR 52.21 or under regulations approved pursuant to 40 CFR 51.18 or 51.166.

“Federal Land Manager” means, with respect to any lands in the United States, the Secretary of the Department with authority over such lands.

“Fugitive emissions” means those emissions which could not reasonably pass through a stack, chimney, vent, or other functionally equivalent opening.

“High terrain” means any area having an elevation 900 feet or more above the base of the stack of a source.

“Indian Governing Body” means the governing body of any tribe, band, or group of Indians subject to the jurisdiction of the United States and recognized by the United States as possessing power of self-Government.

“Indian Reservation” means any federally recognized reservation established by treaty, agreement, executive order, or act of Congress.

“Innovative control technology” means any system of air pollution control that has not been adequately demonstrated in practice, but would have a substantial likelihood of achieving greater continuous emissions reduction than any control system in current practice or of achieving at least comparable reductions at lower cost in terms of energy, economics, or non air quality environmental impacts.

“Lowest achievable emission rate (LAER)” means, for any source, the more stringent rate of emissions based on the following:

(i) The most stringent emissions limitation which is contained in the implementation plan of any State for such class or category of stationary source, unless the owner or operator of the proposed stationary source demonstrates that such limitations are not achievable; or

(ii) The most stringent emissions limitation which is achieved in practice by such class or category of stationary sources. This limitation, when applied to a modification, means the lowest achievable emissions rate for the new or modified emissions units within a stationary source. In no event shall the application of the term permit a proposed new or modified stationary source to emit any pollutant in excess of the amount allowable under an applicable new source standard of performance.

“Low terrain” means any area other than high terrain.

“Major modification” means any physical change in or change in the method of operation of a major stationary source that would result in: a significant emissions increase (as defined in the definition for “Significant emissions increase” in this section) of a regulated NSR pollutant (as defined in the definition for “Regulated NSR pollutant” in this section); and a significant net emissions increase of that pollutant from the major stationary source. Any significant emissions increase (as defined in the definition for “Significant emissions increase” in this section) from any emissions units or net emissions increase (as defined in the definition for “Net emissions increase” in this section) at a major stationary source that is significant for volatile organic compounds or NO_x shall be considered significant for ozone.

(i) A physical change or change in the method of operation shall not include:

(A) Routine maintenance, repair and replacement.

(B) Use of an alternative fuel by reason of an order under section 125 of the Federal Clean Air Act;

(C) An increase in the hours of operation or in the production rate, if such increase does not exceed the operating design capacity of the major stationary source unless such change would be prohibited by, or inconsistent with, an enforceable permit issued by the Division;

(D) Use of an alternative fuel or raw material by reason of an order in effect under sections 2(a) and (b) of the Energy Supply and Environmental Coordination Act of 1974 (or any superseding legislation), or by reason of a natural gas curtailment plan in effect pursuant to the Federal Power Act;

(E) Use of an alternative fuel or raw material, if prior to January 6, 1975, the source was capable of accommodating such fuel or material unless such change would be prohibited by, or inconsistent with, an enforceable permit issued by the Division, or if the source is approved to use such fuel or material through an enforceable permit issued under these regulations;

(F) Change in ownership of the stationary source;

(G) The use of municipal solid waste as an alternative fuel at a steam generating plant;

(H) The installation, operation, cessation or removal of a temporary clean coal technology demonstration project, provided that the project complies with:

(I) The Wyoming State Implementation Plan, and

(II) Other requirements necessary to attain and maintain the national ambient air quality standards during the project and after it is terminated.

(I) The installation or operation of a permanent clean coal technology demonstration project that constitutes repowering, provided that the project does not result in an increase in the potential to emit of any regulated pollutant emitted by the unit. This exemption shall apply on a pollutant-by-pollutant basis.

(J) The reactivation of a very clean coal-fired electric utility steam generating unit.

(ii) This definition shall not apply with respect to a particular regulated NSR pollutant when the major stationary source is complying with the requirements under paragraph (b)(xv) of this section for a PAL for that pollutant. Instead, the definition in paragraph (b)(xv)(B) for “PAL major modification” of this section shall apply.

“Major source baseline date” means:

(i) In the case of particulate matter and sulfur dioxide, January 6, 1975;
and

(ii) In the case of nitrogen dioxide, February 8, 1988.

“Major stationary source” means (a) any of the following stationary sources of air pollutants which emit, or have the potential to emit, one hundred tons per year or more of any air pollutant for which standards are established under these Standards and Regulations or under the Federal Clean Air Act: fossil fuel-fired steam electric plants of more than two hundred and fifty million British thermal units per hour heat input, coal cleaning plants (with thermal dryers), kraft pulp mills, Portland Cement plants, primary zinc smelters, iron and steel mill plants, primary aluminum ore reduction plants (with thermal dryers), primary copper smelters, municipal incinerators capable of charging more than two hundred and fifty tons of refuse per day, hydrofluoric, sulfuric, and nitric

acid plants, petroleum refineries, lime plants, phosphate rock processing plants, coke oven batteries, sulfur recovery plants, carbon black plants (furnace process), primary lead smelters, fuel conversion plants, sintering plants, secondary metal production plants, chemical process plants (which does not include ethanol production facilities that produce ethanol by natural fermentation included in NAICS codes 325193 or 312140), fossil fuel boilers (or combinations thereof) of more than two hundred and fifty million British thermal units per hour heat input, petroleum storage and transfer plants with a capacity exceeding three hundred thousand barrels, taconite ore processing plants, glass fiber processing plants, charcoal production plants. (b) Such term also includes any stationary source which emits, or has the potential to emit, two hundred and fifty tons per year or more of any air pollutant for which standards are established under these Standards and Regulations or under the Federal Clean Air Act. (c) Such term also includes any physical change that would occur at a stationary source not otherwise qualifying under this definition if the change would constitute a major stationary source by itself. (d) A major source which is major for volatile organic compounds or NO_x is considered to be major for ozone.

“Minor source baseline date” means the earliest date after August 7, 1977 for particulate matter and sulfur dioxide, and after February 8, 1988 for nitrogen oxides, on which a major stationary source or major modification submits a complete permit application under Chapter 6, Section 4(b) or under the Federal Clean Air Act.

(i) The minor source baseline date for sulfur dioxide for the State of Wyoming is February 2, 1978.

(ii) The minor source baseline date for nitrogen oxides for the State of Wyoming is February 26, 1988.

(iii) The minor source baseline date for particulate matter is as follows:

(A) For the Powder River Basin Area – March 6, 1997;

(B) For the Pacific Power and Light Area – June 18 1980;

(C) For the Hampshire Energy Area – September 30, 1982;

(D) For the Kennecott-Puron Area – February 27, 1995;

(E) For the rest of the State of Wyoming – February 22, 1979.

(iv) The baseline date is established for each pollutant for which increments or other equivalent measures have been established, if:

(A) The area in which the proposed source or modification would construct is designated as attainment or unclassifiable under the Federal Clean Air Act for the pollutant on the date of its complete application; and

(B) In the case of a major stationary source, the pollutant would be emitted in significant amounts, or in the case of a major modification, there would be a significant net emissions increase of the pollutant.

(v) The baseline date is not established by the permit application for an emitting source or modification which (1) is not listed in Chapter 6, Section 4(a) under the definition for “Major stationary source”, item (a), (2) qualified as “major” prior to August 7, 1980 only because fugitive emissions were included in determining potential to emit, and (3) submitted a complete permit application under Chapter 6, Section 4(b) or the Federal Clean Air Act prior to August 7, 1980.

(vi) Any minor source baseline date established originally for the TSP increments shall remain in effect and shall apply for purposes of determining the amount of available PM₁₀ increments.

“Net emissions increase” means, with respect to any regulated NSR pollutant emitted by a major stationary source, the amount by which the sum of the following exceeds zero:

(i) The increase in emissions from a particular physical change or change in the method of operation at a stationary source as calculated pursuant to paragraph (b)(i)(J) of this section;

(ii) Any other increases and decreases in actual emissions at the major stationary source that are contemporaneous with the particular change and are otherwise creditable. Baseline actual emissions for calculating increases and decreases under this paragraph (ii) shall be determined as provided in the definition for “Baseline actual emissions”, except that paragraphs (i)(C) and (ii)(D) of the definition for “Baseline actual emissions” shall not apply.

(iii) An increase or decrease in actual emissions is contemporaneous with the increase from the particular change only if it occurs between:

(A) The date five years before construction on the particular change commences; and

(B) The date that the increase from the particular change occurs.

(iv) An increase or decrease in actual emissions is creditable only if:

(A) The Division has not relied on it in issuing a Chapter 6, Section 4 permit for the source, which is in effect when the increase in actual emissions from the particular change occurs.

(v) An increase or decrease in actual emissions of sulfur dioxide, particulate matter, or nitrogen oxides that occurs before the applicable minor source baseline date is creditable only if it is required to be considered in calculating the amount of maximum allowable increases remaining available.

(vi) An increase in actual emissions is creditable only to the extent that the new level of actual emissions exceeds the old level.

(vii) A decrease in actual emissions is creditable only to the extent that:

(A) The old level of actual emissions or the old level of allowable emissions, whichever is lower, exceeds the new level of actual emissions;

(B) It is enforceable as a practical matter at and after the time that actual construction on the particular change begins;

(C) It has approximately the same qualitative significance for public health and welfare as that attributed to the increase from the particular change; and

(viii) An increase that results from a physical change at a source occurs when the emissions unit on which construction occurred becomes operational and begins to emit a particular pollutant. Any replacement unit that requires shakedown becomes operational only after a reasonable shakedown period, not to exceed 180 days.

(ix) The definition of “Actual emissions” of this section, shall not apply for determining creditable increases and decreases.

“Potential to emit” means the maximum capacity of a stationary source to emit a pollutant under its physical and operational design. Any physical or operational limitation on the capacity of the source to emit a pollutant, including air pollution control equipment and restrictions on hours of operation or the type or amount of material combusted, stored, or processed, shall be treated as part of its design if the limitation or the affect it would have on emissions is enforceable. Secondary emissions do not count in determining the potential to emit of a stationary source.

“Predictive emissions monitoring system (PEMS)” means all of the equipment necessary to monitor process and control device operational parameters (for example, control device secondary voltages and electric currents) and other information (for example, gas flow rate, O₂ or CO₂ concentrations), and calculate and record the mass emissions rate (for example, lb/hr) on a continuous basis.

“Project” means a physical change in, or change in method of operation of, an existing major stationary source.

“Projected actual emissions” means the maximum annual rate, in tons per year, at which an existing emissions unit is projected to emit a regulated NSR pollutant in any one of the 5 years (12-month period) following the date the unit resumes regular operation after the project, or in any one of the 10 years following that date, if the project involves increasing the emissions unit’s design capacity or its potential to emit that regulated NSR pollutant, and full utilization of the unit would result in a significant emissions increase, or a significant net emissions increase at the major stationary source.

(i) In determining the projected actual emissions under the above paragraph of this section (before beginning actual construction), the owner or operator of the major stationary source:

(A) Shall consider all relevant information, including but not limited to, historical operational data, the company’s own representations, the company’s expected business activity and the company’s highest projections of business activity, the company’s filings with the State or Federal regulatory authorities, and compliance plans approved by the Division;

(B) Shall include fugitive emissions to the extent quantifiable and emissions associated with startups, shutdowns, and malfunctions;

(C) Shall exclude, in calculating any increase in emissions that results from the particular project, that portion of the unit’s emissions following the project that an existing unit could have accommodated during the consecutive 24-month period used to establish the baseline actual emissions under the definition for “Baseline actual emissions” of this section and that are also unrelated to the particular project, including any increased utilization due to product demand growth; or,

(D) In lieu of using the method set out in paragraphs (i)(A) through (C) of this definition, may elect to use the emissions unit’s potential to emit, in tons per year, as defined under the definition of “Potential to emit” of this section.

“Reactivation of a very clean coal-fired electric utility steam generating unit” means any physical change or change in the method of operation associated with the commencement of commercial operations by a coal-fired utility unit after a period of discontinued operation where the unit:

(i) Has not been in operation for the two-year period prior to the enactment of the Clean Air Act Amendments of 1990, and the emissions from such unit continue to be carried in the State of Wyoming’s emissions inventory at the time of enactment;

(ii) Was equipped prior to shut-down with a continuous system of emissions control that achieves a removal efficiency for sulfur dioxide of no less than 85 percent and a removal efficiency for particulates of not less than 98 percent;

(iii) Is equipped with low-NO_x burners prior to the time of commencement of operations following reactivation; and

(iv) Is otherwise in compliance with the requirements of the Clean Air Act.

“Regulated NSR pollutant”, for purposes of this section, means the following:

(i) Any pollutant for which a national ambient air quality standard has been promulgated and any ~~constituents or precursors for such pollutants identified by the EPA Administrator (e.g., volatile organic compounds are precursors for ozone);~~ pollutant identified under this paragraph as a constituent or precursor to such pollutant. Precursors identified by the EPA Administrator for purposes of NSR are the following:

(A) Volatile organic compounds and nitrogen oxides are precursors to ozone in all attainment and unclassifiable areas.

(B) Sulfur dioxide is a precursor to PM_{2.5} in all attainment and unclassifiable areas.

(C) Nitrogen oxides are presumed to be precursors to PM_{2.5} in all attainment and unclassifiable areas, unless the State demonstrates to the EPA Administrator’s satisfaction or EPA demonstrates that emissions of nitrogen oxides from sources in a specific area are not a significant contributor to that area’s ambient PM_{2.5} concentrations.

(D) Volatile organic compounds are presumed not to be precursors to PM_{2.5} in any attainment or unclassifiable area, unless the State demonstrates to the EPA Administrator’s satisfaction or EPA demonstrates that emissions of volatile organic compounds from sources in a specific area are a significant contributor to that area’s ambient PM_{2.5} concentrations.

(ii) Any pollutant that is subject to any standard promulgated under section 111 of the Federal Clean Air Act;

(iii) Any Class I or II substance subject to a standard promulgated under or established by Title VI of the Federal Clean Air Act; or

(iv) Any pollutant that otherwise is subject to regulation under the Federal Clean Air Act; except that any or all hazardous air pollutants either listed in section 112

of the Federal Clean Air Act or added to the list pursuant to section 112(b)(2) of the Federal Clean Air Act, which have not been delisted pursuant to section 112(b)(3) of the Federal Clean Air Act, are not regulated NSR pollutants unless the listed hazardous air pollutant is also regulated as a constituent or precursor of a general pollutant listed under section 108 of the Federal Clean Air Act.

(v) [Reserved.]

(vi) Particulate matter (PM) emissions, PM_{2.5} emissions, and PM₁₀ emissions shall include gaseous emissions from a source or activity which condense to form particulate matter at ambient temperatures. On or after January 1, 2011, such condensable particulate matter shall be accounted for in applicability determinations and in establishing emissions limitations for PM, PM_{2.5} and PM₁₀ in PSD permits. Compliance with emissions limitations for PM, PM_{2.5} and PM₁₀ issued prior to this date shall not be based on condensable particulate matter unless required by the terms and conditions of the permit or the applicable implementation plan. Applicability determinations made prior to this date without accounting for condensable particulate matter shall not be considered in violation of this section unless the applicable implementation plan required condensable particulate matter to be included.

“Replacement unit” means an emissions unit for which all the criteria listed in this section are met. No creditable emission reductions shall be generated from shutting down the existing emissions unit that is replaced.

(i) The emissions unit is a reconstructed unit within the meaning of 40 CFR part 60.15(b)(1), or the emissions unit completely takes the place of an existing emissions unit.

(ii) The emissions unit is identical to or functionally equivalent to the replaced emissions unit.

(iii) The replacement does not change the basic design parameter(s) (as discussed in 40 CFR part 51.166(y)(2)) of the process unit.

(iv) The replaced emissions unit is permanently removed from the major stationary source, otherwise permanently disabled, or permanently barred from operation by a permit that is enforceable as a practical matter. If the replaced emissions unit is brought back into operation, it shall constitute a new emissions unit.

“Repowering” means replacement of an existing coal-fired boiler with one of the following clean coal technologies: atmospheric or pressurized fluidized bed combustion, integrated gasification combined cycle, magnetohydrodynamics, direct and indirect coal-fired turbines, integrated gasification fuel cells, or as determined by the Administrator of

EPA, in consultation with the Secretary of Energy, a derivative of one or more of these technologies, and any other technology capable of controlling multiple combustion emissions simultaneously with improved boiler or generation efficiency and with significantly greater waste reduction relative to the performance of technology in widespread commercial use as of November 15, 1990.

(i) Repowering shall also include any oil and/or gas-fired unit which has been awarded clean coal technology demonstration funding as of January 1, 1991, by the Department of Energy.

(ii) The Administrator shall give expedited consideration to permit applications for any source that satisfies the requirements of this subsection and is granted an extension under section 409 of the Clean Air Act.

“Secondary emissions” means emissions which occur as a result of the construction or operation of a major stationary source or major modification, but do not come from the major stationary source or major modification itself. For the purposes of this section, secondary emissions must be specific, well defined, quantifiable, and impact the same general areas as the stationary source or modification which causes the secondary emissions. Secondary emissions include emissions from any offsite support facility which would not be constructed or increase its emissions except as a result of the construction or modification of the major stationary source or major modification. Secondary emissions do not include any emissions which come directly from a mobile source, such as emissions from the tailpipe of a motor vehicle or from a train.

“Significant” means:

(i) In reference to a net emissions increase or the potential of a source to emit any of the following pollutants, a rate of emissions that would equal or exceed any of the following rates:

POLLUTANT AND EMISSIONS RATE

Carbon monoxide:	100 tons per year (tpy)
Nitrogen oxides:	40 tpy
Sulfur dioxide:	40 tpy
Particulate matter:	25 tpy of particulate matter emissions; 15 tpy of PM ₁₀ emissions
<u>PM_{2.5}:</u>	<u>10 tpy of direct PM_{2.5} emissions;</u> <u>40 tpy of sulfur dioxide emissions;</u> <u>40 tpy of nitrogen oxide emissions</u> <u>unless demonstrated not to be a</u> <u>PM_{2.5} precursor under the definition</u>

	<u>of “Regulated NSR pollutant” in Section 4(a) of this chapter</u>
Ozone:	40 tpy of volatile organic compounds <u>or nitrogen oxides</u>
Lead:	0.6 tpy
Fluorides:	3 tpy
Sulfuric acid mist:	7 tpy
Hydrogen sulfide (H ₂ S):	10 tpy
Total reduced sulfur (including H ₂ S):	10 tpy
Reduced sulfur compounds (including H ₂ S):	10 tpy
Municipal waste combustor organics (measured as total tetra- through octa-chlorinated dibenzo-p-dioxins and dibenzofurans):	3.2 x 10 ⁻⁶ megagrams per year (3.5 x 10 ⁻⁶ tons per year)
Municipal waste combustor metals (measured as particulate matter):	14 megagrams per year (15 tons per year)
Municipal waste combustor acid gases (measured as sulfur dioxide and hydrogen chloride):	36 megagrams per year (40 tons per year)
Municipal solid waste landfill emissions (measured as nonmethane organic compounds):	50 tpy <u>45 megagrams per year (50 tons per year)</u>

(ii) “Significant” means, in reference to a net emissions increase or the potential of a source to emit a pollutant subject to these regulations and regulations under the Clean Air Act, that paragraph (i) above does not list, any emissions rate.

(iii) Notwithstanding paragraph (i) above, “significant” means any emissions rate or any net emissions increase associated with a major stationary source or major modification which would construct within 10 kilometers of a Class I Area, and have an impact on such area equal to or greater than 1 µg/m³ (24-hour average).

“Significant emissions increase” means, for a regulated NSR pollutant, an increase in emissions that is significant (as defined in paragraph (i) of the definition of “Significant” in this section) for that pollutant.

“Stationary source” means any structure, building, facility, equipment, installation or operation (or combination thereof) which emits or may emit any air pollutant subject to these regulations or regulations under the Federal Clean Air Act.

“Structure, building, facility, equipment, installation, or operation” means all of the pollutant-emitting activities which belong to the same industrial grouping, are located

on one or more contiguous or adjacent properties, and are under the control of the same person (or persons under common control) except the activities of any vessel. Pollutant-emitting activities shall be considered as part of the same industrial grouping if they belong to the same *Major Group* (i.e., which have the same two-digit code) as described in the *Standard Industrial Classification Manual, 1972*, as amended by the 1977 Supplement (U.S. Government Printing Office stock numbers 4101-0066 and 003-005-00176-0, respectively).

“Temporary clean coal technology demonstration project” means a clean coal technology demonstration project that is operated for a period of 5 years or less, and which complies with the Wyoming State Implementation Plan and other requirements necessary to attain and maintain the national ambient air quality standards during the project and after it is terminated.

“Volatile organic compounds (VOCs)” is defined in Chapter 3, Section 6(a) of these regulations.

(b) Any person who plans to construct any major stationary source or undertake a major modification of an existing stationary source shall be subject to the conditions outlined below.

(i) (A) (I) The review of the stationary source for the construction or modification permit(s) required under Chapter 6, Section 2 of these regulations shall apply and shall be expanded so as to include analysis of the predicted impact of the allowable and secondary emissions from the stationary source on the ambient air quality in areas affected by such emissions. An analysis of the predicted impact of emissions from the stationary source is required for all pollutants for which standards have been established under these regulations or under the Federal Clean Air Act and which are emitted in significant amounts. An analysis of the impact of other pollutants may be required by the Administrator. Such analysis shall identify and quantify the impact on the air quality in the area of all emissions not included in the baseline concentrations including, but not limited to, those emissions resulting from the instant application and all other permits issued in the area. The purpose of this analysis is to determine the total deterioration of air quality from the baseline concentrations; however, projections of deterioration due to general non-stationary source growth in the area predicted to occur after the date of application is not required. A permit to construct pursuant to Chapter 6, Section 2 shall be issued only if the conditions of Chapter 6, Section 2 are complied with and if the predicted impact (over and above the baseline concentration) of emissions defined above is less than the maximum allowable increment shown in Table 1 for the classification of the area in which the impact is predicted and if the ambient standard for the pollutant(s) is not exceeded.

Table 1
Maximum Allowable Increments of Deterioration - $\mu\text{g}/\text{m}^3$

Pollutant	Class I	Class II
Particulate Matter:		
PM ₁₀ , annual arithmetic mean	4	17
PM ₁₀ , 24-hour maximum	8	30
Sulfur Dioxide:		
Annual arithmetic mean	2	20
24-hour maximum*	5	91
3-hour maximum*	25	512
Nitrogen Dioxide		
Annual arithmetic mean	2.5	25

*Maximum allowable increment may be exceeded once per year at any receptor site.

(II) Notwithstanding the provisions of paragraph (b)(i)(A)(I) above, the following concentrations shall be excluded in determining compliance with maximum allowable increases:

(1.) Concentrations attributable to the increase in emissions from stationary sources which have converted from the use of petroleum products, natural gas, or both by reason of an order in effect under sections 2(a) and (b) of the Energy Supply and Environmental Coordination Act of 1974 (or any superseding legislation) over the emissions from such sources before the effective date of such an order. No such exclusion shall apply for more than five years after the later of such effective dates;

(2.) Concentrations attributable to the increase in emissions from sources which have converted from using natural gas by reason of natural gas curtailment plan in effect pursuant to the Federal Power Act over the emissions from such sources before the effective date of such plan. No such exclusion shall apply for more than 5 years after the later of such effective date;

(3.) Concentrations of particulate matter attributable to the increase in emissions from construction or other temporary emission-related activities of new or modified sources;

(4.) The increase in concentrations attributable to new sources outside the United States over the concentrations attributable to existing sources which are included in the baseline concentrations; and

(5.) Concentrations attributable to the temporary increase in emissions of sulfur dioxide, particulate matter, or nitrogen oxides from stationary sources as specified below.

a. The temporary emissions do not occur for more than 2 years.

b. The 2-year time period is not renewable.

c. Such temporary emissions are not eligible for exclusion if they would impact a Class I Area or an area where the applicable increment is known to be violated or an area where they would cause or contribute to a violation of the applicable ambient air quality standard.

d. At the end of the temporary emission time frame, emissions from the stationary source causing these temporary emissions shall not exceed those levels occurring at such source prior to such temporary emission.

(B) In addition to the analyses required under Chapter 6, Section 4(b)(i)(A) above,

(I) The owner or operator shall provide an analysis of the impairment to visibility, soils and vegetation that would occur as a result of the source or modification and general commercial, residential, industrial, and other growth associated with the source or modification. The owner or operator need not provide an analysis of the impact on vegetation having no significant commercial or recreational value.

(II) The owner or operator shall provide an analysis of the air quality impact projected for the area as a result of general commercial, residential, industrial and other growth associated with the source or modification.

(C) The requirements for demonstration of compliance with applicable increments of Chapter 6, Section 4(b)(i)(A)(I), the additional analysis requirements of Chapter 6, Section 4(b)(i)(B) and the ambient air quality analysis requirements of Chapter 6, Section 4(b)(i)(E) shall not apply to a proposed major stationary source or modification with respect to a particular pollutant if the Administrator determines that:

(I) The increase in allowable emissions of that pollutant from the stationary source or the net emissions increase of that pollutant from a modification would be temporary and would impact no Class I Area and no area where an applicable increment is known to be violated; or

(II) The stationary source was in existence on March 1, 1978, and that the maximum allowable emission increases only impact Class II Areas, and that after application of BACT, the increase in allowable emissions of each pollutant would be less than 50 tons per year.

(D) Fugitive emissions, to the extent quantifiable, will be considered in calculating the potential to emit of the stationary source or modification only for:

(I) Sources listed in Chapter 6, Section 4(a) under the definition of "Major stationary source", item (a).

(II) Any other stationary source category which, as of August 7, 1980, is being regulated under section 111 or 112 of the Clean Air Act.

(III) And such other sources as the Environmental Quality Council may later determine.

(E) An application subject to this section shall contain an analysis of ambient air quality in the area that would be affected by the stationary source or modification as required below:

(I) For each pollutant that the source would have the potential to emit in a significant amount.

(II) For the modification, each pollutant for which it would result in a significant net emissions increase.

(III) For pollutants for which National Ambient Air Quality Standards have been established, the analysis shall contain continuous air quality monitoring data gathered for purposes of determining whether emissions of that pollutant would cause or contribute to a violation of the standard or any maximum allowable increase.

(IV) In general, the required continuous air quality monitoring data shall have been gathered over a period of one year immediately preceding receipt of the application. The Administrator may provide that the monitoring period specification may be reduced to a minimum of four months if he is satisfied that a complete and adequate analysis can be accomplished with monitoring data gathered over a period shorter than one year.

(V) All monitoring conducted pursuant to the requirements of this section shall meet the requirements of Appendix B of 40 CFR part 58.

(VI) The requirements for pre-construction monitoring specified above and under Chapter 6, Section 2(b) with respect to monitoring for a particular pollutant may be waived by the Administrator upon petition from an applicant if:

(1.) The emissions increase of the pollutant from a new stationary source or the net emissions increase of the pollutant from a modification would cause, in any area, air quality impacts less than the following amounts:

- a. Carbon Monoxide - 575 $\mu\text{g}/\text{m}^3$, 8-hour average;
- b. Nitrogen Dioxide - 14 $\mu\text{g}/\text{m}^3$, annual average;
- c. Particulate Matter - 10 $\mu\text{g}/\text{m}^3$ of PM_{10} , 24-hour average;
- d. Sulfur Dioxide - 13 $\mu\text{g}/\text{m}^3$, 24-hour average;
- e. Ozone (No “De Minimis” *de minimis* air quality level is provided for ozone; however, any net emissions increase of 100 tons per year or more of volatile organic compounds or nitrogen oxides subject to PSD would be required to perform an ambient impact analysis, including the gathering of ~~ambient~~ air quality data.)
- f. Lead - 0.1 $\mu\text{g}/\text{m}^3$, 3-month average;
- g. Fluorides - 0.25 $\mu\text{g}/\text{m}^3$, 24-hour average;
- h. Total Reduced Sulfur - 10 $\mu\text{g}/\text{m}^3$, 1-hour average;
- i. Hydrogen Sulfide - 0.2 $\mu\text{g}/\text{m}^3$, 1-hour average;
- j. Reduced Sulfur Compounds - 10 $\mu\text{g}/\text{m}^3$, 1-hour average; or

(2.) The concentrations of the pollutant in the area that the source or modification would affect are less than the concentrations listed ~~above~~ in paragraph (b)(i)(E)(VI)(1.) of this section; or

(3.) The pollutant is not listed above in paragraph (b)(i)(E)(VI)(1.) of this section.

(F) The Administrator may require an applicant subject to the provisions of this section to conduct an approved visibility monitoring program in any Class I Area which may be impacted by emissions from the proposed stationary source.

(G) At such time that a particular source or modification becomes a major stationary source or major modification solely by virtue of a relaxation in any enforceable limitation which was established after August 7, 1980 on the capacity of the source or modification otherwise to emit a pollutant, then all of the provisions of Chapter 6, Sections 2 and 4 shall apply to the source or modification as though construction had not yet commenced on the source or modification.

(H) The following specific provisions apply to projects at existing emissions units at a major stationary source (other than projects at a source with a PAL) in circumstances where the owner or operator elects to use the method specified in paragraphs (i)(A) through (C) of the definition for "Projected actual emissions" for calculating projected actual emissions.

(I) Before beginning actual construction of the project, the owner or operator shall document and maintain a record of the following information:

(1.) A description of the project;

(2.) Identification of the emissions unit(s) whose emissions of a regulated NSR pollutant could be affected by the project; and

(3.) A description of the applicability test used to determine that the project is not a major modification for any regulated NSR pollutant, including the baseline actual emissions, the projected actual emissions, the amount of emissions excluded under paragraph (i)(C) of the definition for "Projected actual emissions" in Section 4(a) and an explanation for why such amount was excluded, and any netting calculations, if applicable.

(II) Before beginning actual construction, the owner or operator shall provide the information set out in paragraph (b)(i)(H)(I) of this section to the Division as a Chapter 6, Section 2 permit application.

(III) The owner or operator shall monitor the emissions of any regulated NSR pollutant that could increase as a result of the project and that is emitted by any emissions unit identified in paragraph (b)(i)(H)(I)(2.) of this section; and calculate and maintain a record of the annual emissions, in tons per year on a calendar year basis, for a period of 5 years following resumption of regular operations after the

change, or for a period of 10 years following resumption of regular operations after the change if the project increases the design capacity or potential to emit of that regulated NSR pollutant at such emissions unit.

(IV) The owner or operator shall submit a report to the Division within 60 days after the end of each year during which records must be generated under paragraph (b)(i)(H)(III) of this section setting out the unit's annual emissions during the calendar year that preceded submission of the report.

(I) The owner or operator of the source shall make the information required to be documented and maintained pursuant to paragraph (b)(i)(H) of this section available for review upon request for inspection by the Division or the general public pursuant to the requirements contained in 40 CFR 70.4(b)(3)(viii).

(J) (I) Except as otherwise provided in paragraph (b)(xv) of this section, and consistent with the definition of "Major modification" contained in Section 4(a), a project is a major modification for a regulated NSR pollutant if it causes two types of emissions increases—a significant emissions increase (as defined in the definition for "Significant emissions increase" in Section 4(a)), and a significant net emissions increase (as defined in the definitions for "Net emissions increase" and "Significant" in Section 4(a)). The project is not a major modification if it does not cause a significant emissions increase. If the project causes a significant emissions increase, then the project is a major modification only if it also results in a significant net emissions increase.

(II) The procedure for calculating (before beginning actual construction) whether a significant emissions increase (i.e., the first step of the process) will occur depends upon the type of emissions units being modified, according to paragraphs (b)(i)(J)(III) through (V) of this section. The procedure for calculating (before beginning actual construction) whether a significant net emissions increase will occur at the major stationary source (i.e., the second step of the process) is contained in the definition for "Net emissions increase" in Section 4(a). Regardless of any such preconstruction projections, a major modification results if the project causes a significant emissions increase and a significant net emissions increase.

(III) Actual-to-Projected-Actual Applicability Test For Projects That Only Involve Existing Emissions Units. A significant emissions increase of a regulated NSR pollutant is projected to occur if the sum of the difference between the projected actual emissions (as defined in the definition for "Projected actual emissions" in Section 4(a)) and the baseline actual emissions (as defined in paragraphs (i) and (ii) in the definition of "Baseline actual emissions" in Section 4(a)) for each existing emissions unit, equals or exceeds the significant amount for that pollutant (as defined in the definition of "Significant" in Section 4(a)).

(IV) Actual-to-Potential Test For Projects That Only Involve Construction of a New Emissions Unit(s). A significant emissions increase of a regulated NSR pollutant is projected to occur if the sum of the difference between the potential to emit (as defined in the definition for “Potential to emit” in Section 4(a)) from each new emissions unit following completion of the project and the baseline actual emissions (as defined in paragraph (iii) for the definition of “Baseline actual emissions” in Section 4(a)) of these units before the project equals or exceeds the significant amount for that pollutant (as defined in the definition of “Significant” in Section 4(a)).

(V) Hybrid Test For Projects That Involve Multiple Types of Emissions Units. A significant emissions increase of a regulated NSR pollutant is projected to occur if the sum of the emissions increases for each emissions unit, using the method specified in paragraphs (b)(i)(J)(III) and (IV) of this section as applicable with respect to each emissions unit, for each type of emissions unit equals or exceeds the significant amount for that pollutant (as defined in the definition of “Significant” in Section 4(a)).

(ii) (A) The required permit shall not be issued unless the proposed major stationary source or major modification would meet an emission limit(s) or equipment standard(s) specified by the Administrator to represent the application of Best Available Control Technology for each pollutant regulated under these Standards and Regulations and under the Federal Clean Air Act and having the potential to emit in significant amounts. For phased construction projects, the determination of BACT shall be reviewed and modified as appropriate at the latest, most reasonable time no later than 18 months prior to commencement of each phase of the proposed project. At such time, the owner or operator of the applicable stationary source may be required to demonstrate the adequacy of any previous determination of best available control technology for the stationary source.

(B) In the case of a major modification, the requirements for Best Available Control Technology shall apply only to each new or modified emissions unit at which a net emissions increase of the pollutant would occur.

(C) (I) The applicant for a permit for a source subject to this section may petition the Administrator to approve a system of innovative control technology.

(II) The Administrator, with the approval of the governor(s) of other affected state(s) may approve the employment of a system of innovative control technology if:

(1.) The proposed control system would not cause or contribute to an unreasonable risk to public health, welfare, or safety in its operation or function;

(2.) The owner or operator agrees to achieve a level of continuous emissions reduction equivalent to that which would have been required under paragraphs (ii)(A) and (B) above by a date specified by the Administrator. Such date shall not be later than 4 years from the time of startup or 7 years from permit issuance.

(3.) The major stationary source or major modification would meet the requirements equivalent to those in paragraphs (b)(i)(A)(I), (b)(ii)(A), and (b)(ii)(B) above based on the emission rate that the stationary source employing the system of innovative control technology would be required to meet on the date specified by the Administrator.

(4.) The source or modification would not before the date specified by the Administrator:

a. Cause or contribute to any violation of an applicable National Ambient Air Quality Standard, or

b. Impact any Class I Area, or

c. Impact any area where an applicable increment is known to be violated.

(5.) All other applicable requirements including those for public participation have been met.

(III) The approval to employ a system of innovative control technology shall be withdrawn by the Administrator if:

(1.) The proposed system fails by the specified date to achieve the required continuous emissions reduction rate, or

(2.) The proposed system fails before the specified date so as to contribute to an unreasonable risk to public health, welfare, or safety, or

(3.) The Administrator decides at any time that the proposed system is unlikely to achieve the required level of control or to protect the public health, welfare, or safety.

(IV) If the source or modification fails to meet the required level of continuous emissions reduction within the specified time period or if the approval is withdrawn in accordance with (III) above, the Administrator may allow the source or

modification up to an additional three years to meet the requirement for the application of BACT through use of a demonstrated system of control.

(iii) Temporary particulate matter emissions such as those associated with the construction phase of the source shall not be included in the determination on the issuance or denial of a required permit and shall not be taken into account when determining compliance with the maximum allowable increments in Table 1; however, Best Available Control Technology shall be applied to abate such temporary emission.

(iv) All applications of air quality modeling required under paragraph (b)(i) above shall be based on the applicable models, databases, and other requirements specified in Appendix W of 40 CFR part 51 (Guideline on Air Quality Models). Where an air quality model specified in Appendix W of 40 CFR part 51 (Guideline on Air Quality Models) is inappropriate, the model may be modified or another model substituted. Such a modification or substitution of a model may be made on a case-by-case basis or, where appropriate, on a generic basis for a specific State of Wyoming program. Written approval of the EPA Administrator must be obtained for any modification or substitution. In addition, use of a modified or substituted model must be subject to notice and opportunity for public comment under procedures set forth in Chapter 6, Section 2(g).

(v) In any case where the federal official charged with direct responsibility for management of any lands within a Class I Area, or the Administrator of EPA or the governor of an adjacent state containing such a Class I Area, files a notice alleging that emissions from a proposed source or major modification may cause or contribute to a change in the air quality in such area and identifying the potential adverse impact of such change, a permit shall not be issued unless the owner or operator of such source demonstrates to the satisfaction of the Administrator that emissions of particulate matter, sulfur dioxide, and nitrogen oxides will not cause or contribute to concentrations which exceed the maximum allowable increases for the Class I Area in question.

(vi) (A) In any case where a Federal Land Manager demonstrates to the satisfaction of the Administrator that the emissions from such source will have an adverse impact on the air quality-related values (including visibility) of such Class I Areas, notwithstanding the fact that the change in air quality resulting from emissions from such source will not cause or contribute to concentrations which exceed the maximum allowable increases for Class I Areas, a permit shall not be issued.

(B) However, in the case where the Federal Land Manager provides to the Division at least 30 days prior to the Public Notice issued pursuant to Chapter 6, Section 2(m) of these regulations, an analysis of the impact of the emissions on visibility in a Federal Class I Area, the Division must consider such analysis in making its proposed decision. If the Federal Land Manager's analysis concludes that an adverse impact on visibility in the Federal Class I Area will occur but the Administrator

determines that the analysis does not demonstrate to his satisfaction that such an adverse impact on visibility will occur, the Administrator shall in the Public Notice issued pursuant to the requirements of Chapter 6, Section 2(m), explain his decision or give notice as to where the explanation can be obtained.

(vii) In any case where the owner or operator of such source demonstrates to the satisfaction of the Federal Land Manager, and the Federal Land Manager so certifies, that the emissions from such source will have no adverse impact on the air quality-related values of such Class I Areas (including visibility) notwithstanding the fact that the change in air quality resulting from emissions from such source will cause or contribute to concentrations which exceed the maximum allowable increases for Class I Areas, the Administrator may issue a permit.

(viii) In the case of a permit issued pursuant to subsection (vii), such source shall comply with such emission limitation under such permit as may be necessary to assure that emissions of sulfur oxides, particulate matter, and nitrogen oxides from such source, will not cause or contribute to concentrations of such pollutant which exceeds the following maximum allowable increases over the baseline concentration for such pollutants:

	Maximum Allowable Increase (micrograms per cubic meter)
Particulate matter:	
PM ₁₀ , annual arithmetic mean	17
PM ₁₀ , 24-hour maximum	30
Sulfur dioxide:	
Annual arithmetic mean	20
Twenty-four-hour maximum	91
Three-hour maximum	325
Nitrogen dioxide:	
Annual arithmetic mean	25

(ix) (A) In any case where the owner or operator of a proposed major stationary source or major modification who has been denied a certification under subparagraph (vii) demonstrates to the satisfaction of the Governor of Wyoming (hereinafter the Governor), after notice and public hearing, and the Governor finds, that the source cannot be constructed by reason of any maximum allowable increases for sulfur dioxide for periods of twenty-four hours or less applicable to any Class I Area and, in the case of federal Mandatory Class I Areas, that a variance under this clause will not adversely affect the air quality related values of the area (including visibility), the Governor, after consideration of the Federal Land Manager's recommendation (if any) and subject to his concurrence, may grant a variance from such maximum allowable increase. If a variance is granted, a permit may be issued to such source pursuant to the requirements of this subparagraph provided other requirements of this section are met.

(B) In the case of a permit issued pursuant to subparagraph (ix)(A), such source shall comply with such emission limitations under such permit as may be necessary to assure that emissions of sulfur oxides from such source will not (during any day on which the otherwise applicable maximum allowable increases are exceeded) cause or contribute to concentrations which exceed the following maximum allowable increases for such areas over the baseline concentration for such pollutant and to assure that such emissions will not cause or contribute to concentrations which exceed the otherwise applicable maximum allowable increases for periods of exposure of 24 hours or less on more than 18 days during any annual period.

	Maximum Allowable Increase (micrograms per cubic meter)
Period of exposure:	
Low terrain areas:	
24-hr maximum	36
3-hr maximum	130
High terrain areas:	
24-hr. maximum	62
3-hr maximum	221

(x) Notwithstanding other requirements of this section, a portable source which is a major stationary source and which has otherwise received a construction permit under Chapter 6, Sections 2 and 4 shall not be required to obtain additional relocation permits under this section if:

(A) Emissions from the source would not exceed allowable emissions; and

(B) Such relocation would impact no Class I Area and no area where an applicable increment is known to be violated; and

(C) Notice is given to the Division at least 10 days prior to such relocation identifying the proposed new location and the probable duration of operation at such location; and

(D) Emissions at the new location will be temporary.

(xi) After a final decision is made on an application for a source subject to this section, the final decision will be transmitted in writing to the applicant and the final decision and all comments received by the Division during the public comment period will be made available for public inspection in the same location where the application and analysis was posted. A copy of each permit application for each source or modification subject to this section and impacting a Federal Class I Area will be

transmitted to EPA. EPA will be provided with notice of each action taken by the Division on such application.

(xii) [Reserved.]

(xiii) [Reserved.]

(xiv) [Reserved.]

(xv) Actuals Plantwide Applicability Limitations (PALs).

(A) Applicability.

(I) The Division may approve the use of an actuals PAL for any existing major stationary source if the PAL meets the requirements in paragraphs (b)(xv)(A) through (O) of this section. The term “PAL” shall mean “actuals PAL” throughout paragraph (b)(xv) of this section.

(II) Any physical change in or change in the method of operation of a major stationary source that maintains its total source-wide emissions below the PAL level, meets the requirements in paragraphs (b)(xv)(A) through (O) of this section, and complies with the PAL permit:

(1.) Is not a major modification for the PAL pollutant;

(2.) Does not have to be approved through a Chapter 6, Section 4 permit; and

(3.) Is not subject to the provisions in paragraph (b)(i)(G) of this section (restrictions on relaxing enforceable emission limitations that the major stationary source used to avoid applicability of Chapter 6, Section 4).

(III) Except as provided under paragraph (b)(xv)(A)(II)(3.) of this section, a major stationary source shall continue to comply with all applicable Federal or State of Wyoming requirements, emission limitations, and work practice requirements that were established prior to the effective date of the PAL.

(B) Definitions. The following definitions shall be used for actuals PALs consistent with paragraphs (b)(xv)(A) through (O) of this section. When a term is not defined in these paragraphs, it shall have the meaning given in Section 4(a) of this section or in the Clean Air Act.

“Actuals PAL for a major stationary source” means a PAL based on the baseline actual emissions (as defined in the definition for “Baseline actual emissions” in Section 4(a)) of all emissions units (as defined in the definition for “Source” in Section 4(a)) at the source, that emit or have the potential to emit the PAL pollutant.

“Allowable emissions” has the same meaning as in the definition for “Allowable emissions” in Section 4(a), except as this definition is modified according to paragraphs (i) and (ii) of this definition.

(i) The allowable emissions for any emissions unit shall be calculated considering any emission limitations that are enforceable as a practical matter on the emissions unit’s potential to emit.

(ii) An emissions unit’s potential to emit shall be determined using the definition of “Potential to emit” in Section 4(a), except that the words “or enforceable as a practical matter” should be added after “enforceable”.

“Major emissions unit” means:

(i) Any emissions unit that emits or has the potential to emit 100 tons per year or more of the PAL pollutant in an attainment area; or

(ii) Any emissions unit that emits or has the potential to emit the PAL pollutant in an amount that is equal to or greater than the major source threshold for the PAL pollutant as defined by the Clean Air Act for nonattainment areas. (For example, in accordance with the definition of major stationary source in section 182(c) of the Clean Air Act, an emissions unit would be a major emissions unit for VOC if the emissions unit is located in a serious ozone nonattainment area and it emits or has the potential to emit 50 or more tons of VOC per year.)

“PAL effective date” generally means the date of issuance of the PAL permit; however, the PAL effective date for an increased PAL is the date any emissions unit that is part of the PAL major modification becomes operational and begins to emit the PAL pollutant.

“PAL effective period” means the period beginning with the PAL effective date and ending 10 years later.

“PAL major modification” means, notwithstanding the definitions for “Major modification” and “Net emissions increase” of Section 4(a), any physical change in or change in the method of operation of the PAL source that causes it to emit the PAL pollutant at a level equal to or greater than the PAL.

“PAL permit” means the Chapter 6, Section 2 or Section 4 permit issued by the Division that establishes a PAL for a major stationary source.

“PAL pollutant” means the pollutant for which a PAL is established at a major stationary source.

“Plantwide applicability limitation (PAL)” means an emission limitation expressed in tons per year, for a pollutant at a major stationary source, that is enforceable as a practical matter and established source-wide in accordance with paragraphs (b)(xv)(A) through (O) of this section.

“Significant emissions unit” means an emissions unit that emits or has the potential to emit a PAL pollutant in an amount that is equal to or greater than the significant level (as defined in the definition for “Significant” in Section 4(a) or in the Clean Air Act, whichever is lower) for that PAL pollutant, but less than the amount that would qualify the unit as a major emissions unit as defined in paragraph (b)(xv)(B) for the definition of “Major emissions unit” of this section.

“Small emissions unit” means an emissions unit that emits or has the potential to emit the PAL pollutant in an amount less than the significant level for that PAL pollutant, as defined in the definition for “Significant” in Section 4(a) or in the Clean Air Act, whichever is lower.

(C) Permit Application Requirements. As part of a permit application requesting a PAL, the owner or operator of a major stationary source shall submit the following information in paragraphs (b)(xv)(C)(I) through (III) of this section to the Division for approval.

(I) A List of All Emissions Units at the Source Designated as Small, Significant or Major Based on Their Potential to Emit. In addition, the owner or operator of the source shall indicate which, if any, Federal or State of Wyoming applicable requirements, emission limitations, or work practices apply to each unit.

(II) Calculations of the Baseline Actual Emissions (With Supporting Documentation). Baseline actual emissions are to include emissions associated not only with operation of the unit, but also emissions associated with startup, shutdown, and malfunction.

(III) The calculation procedures that the major stationary source owner or operator proposes to use to convert the monitoring system data to monthly emissions and annual emissions based on a 12-month rolling total for each month as required by paragraph (b)(xv)(M)(I) of this section.

(D) General Requirements For Establishing PALs.

(I) The Division may establish a PAL at a major stationary source, provided that at a minimum, the requirements in paragraphs (b)(xv)(D)(I)(1.) through (7.) of this section are met.

(1.) The PAL shall impose an annual emission limitation in tons per year, that is enforceable as a practical matter, for the entire major stationary source. For each month during the PAL effective period after the first 12 months of establishing a PAL, the major stationary source owner or operator shall show that the sum of the monthly emissions from each emissions unit under the PAL for the previous 12 consecutive months is less than the PAL (a 12-month average, rolled monthly). For each month during the first 11 months from the PAL effective date, the major stationary source owner or operator shall show that the sum of the preceding monthly emissions from the PAL effective date for each emissions unit under the PAL is less than the PAL.

(2.) The PAL shall be established in a PAL permit that meets the public participation requirements in paragraph (b)(xv)(E) of this section.

(3.) The PAL permit shall contain all the requirements of paragraph (b)(xv)(G) of this section.

(4.) The PAL shall include fugitive emissions, to the extent quantifiable, from all emissions units that emit or have the potential to emit the PAL pollutant at the major stationary source.

(5.) Each PAL shall regulate emissions of only one pollutant.

(6.) Each PAL shall have a PAL effective period of 10 years.

(7.) The owner or operator of the major stationary source with a PAL shall comply with the monitoring, recordkeeping, and reporting requirements provided in paragraphs (b)(xv)(L) through (N) of this section for each emissions unit under the PAL through the PAL effective period.

(II) At no time (during or after the PAL effective period) are emissions reductions of a PAL pollutant that occur during the PAL effective period creditable as decreases for purposes of offsets under 40 CFR Part 51.165(a)(3)(ii) unless the level of the PAL is reduced by the amount of such emissions reductions and such reductions would be creditable in the absence of the PAL.

(E) Public Participation Requirements For PALs. PALs for existing major stationary sources shall be established, renewed, or increased, through a

procedure that is consistent with Chapter 6, Section 2. This includes the requirement that the Division provide the public with notice of the proposed approval of a PAL permit and at least a 30-day period for submittal of public comment. The Division must address all material comments before taking final action on the permit.

(F) Setting the 10-Year Actuals PAL Level.

(I) Except as provided in paragraph (b)(xv)(F)(II) of this section, the actuals PAL level for a major stationary source shall be established as the sum of the baseline actual emissions (as defined in the definition for “Baseline actual emissions” in Section 4(a)) of the PAL pollutant for each emissions unit at the source; plus an amount equal to the applicable significant level for the PAL pollutant under the definition of “Significant” in Section 4(a) or under the Clean Air Act, whichever is lower. When establishing the actuals PAL level, for a PAL pollutant, only one consecutive 24-month period must be used to determine the baseline actual emissions for all existing emissions units; however, a different consecutive 24-month period may be used for each different PAL pollutant. Emissions associated with units that were permanently shut down after this 24-month period must be subtracted from the PAL level. The Division shall specify a reduced PAL level(s) (in tons/yr) in the PAL permit to become effective on the future compliance date(s) of any applicable Federal or State of Wyoming regulatory requirement(s) that the Division is aware of prior to issuance of the PAL permit. For instance, if the source owner or operator will be required to reduce emissions from industrial boilers in half from baseline emissions of 60 ppm NO_x to a new rule limit of 30 ppm, then the permit shall contain a future effective PAL level that is equal to the current PAL level reduced by half of the original baseline emissions of such unit(s).

(II) For newly constructed units (which do not include modifications to existing units) on which actual construction began after the 24-month period, in lieu of adding the baseline actual emissions as specified in paragraph (b)(xv)(F)(I) of this section, the emissions must be added to the PAL level in an amount equal to the potential to emit of the units.

(G) Contents of the PAL Permit. The PAL permit shall contain, at a minimum, the information in paragraphs (b)(xv)(G)(I) through (X) of this section.

(I) The PAL pollutant and the applicable source-wide emission limitation in tons per year.

(II) The PAL permit effective date and the expiration date of the PAL (PAL effective period).

(III) Specification in the PAL permit that if a major stationary source owner or operator applies to renew a PAL in accordance with paragraph (b)(xv)(J) of this section before the end of the PAL effective period, then the PAL shall

not expire at the end of the PAL effective period. It shall remain in effect until a revised PAL permit is issued by the Division.

(IV) A requirement that emission calculations for compliance purposes include emissions from startups, shutdowns and malfunctions.

(V) A requirement that, once the PAL expires, the major stationary source is subject to the requirements of paragraph (b)(xv)(I) of this section.

(VI) The calculation procedures that the major stationary source owner or operator shall use to convert the monitoring system data to monthly emissions and annual emissions based on a 12-month rolling total for each month as required by paragraph (b)(xv)(C)(I) of this section.

(VII) A requirement that the major stationary source owner or operator monitor all emissions units in accordance with the provisions under paragraph (b)(xv)(M) of this section.

(VIII) A requirement to retain the records required under paragraph (b)(xv)(M) of this section on site. Such records may be retained in an electronic format.

(IX) A requirement to submit the reports required under paragraph (b)(xv)(N) of this section by the required deadlines.

(X) Any other requirements that the Division deems necessary to implement and enforce the PAL.

(H) PAL Effective Period and Reopening of the PAL Permit.

(I) PAL Effective Period. The PAL effective period shall be 10 years.

(II) Reopening of the PAL Permit.

(1.) During the PAL effective period, the Division shall reopen the PAL permit to:

a. Correct typographical/calculation errors made in setting the PAL or reflect a more accurate determination of emissions used to establish the PAL;

b. Reduce the PAL if the owner or operator of the major stationary source creates creditable emissions reductions for use as offsets under 40 CFR part 51.165(a)(3)(ii); and

c. Revise the PAL to reflect an increase in the PAL as provided under paragraph (b)(xv)(K) of this section.

(2.) The Division may reopen the PAL permit for the following:

a. Reduce the PAL to reflect newly applicable Federal requirements (for example, NSPS) with compliance dates after the PAL effective date;

b. Reduce the PAL consistent with any other requirement, that is enforceable as a practical matter, and that the Division may impose on the major stationary source; and

c. Reduce the PAL if the Division determines that a reduction is necessary to avoid causing or contributing to a NAAQS or PSD increment violation, or to an adverse impact on an AQRV that has been identified for a Federal Class I Area by a Federal Land Manager and for which information is available to the general public.

(3.) Except for the permit reopening in paragraph (b)(xv)(H)(II)(1.)a. of this section for the correction of typographical/calculation errors that do not increase the PAL level, all reopenings shall be carried out in accordance with the public participation requirements of paragraph (b)(xv)(E) of this section.

(I) Expiration of a PAL. Any PAL that is not renewed in accordance with the procedures in paragraph (b)(xv)(J) of this section shall expire at the end of the PAL effective period, and the requirements in paragraphs (b)(xv)(I)(I) through (V) of this section shall apply.

(I) Each emissions unit (or each group of emissions units) that existed under the PAL shall comply with an allowable emission limitation under a revised permit established according to the procedures in paragraphs (b)(xv)(I)(I)(1.) and (2.) of this section.

(1.) Within the time frame specified for PAL renewals in paragraph (b)(xv)(J)(II) of this section, the major stationary source shall submit a proposed allowable emission limitation for each emissions unit (or each group of emissions units, if such a distribution is more appropriate as decided by the Division) by distributing the PAL-allowable emissions for the major stationary source among each

of the emissions units that existed under the PAL. If the PAL had not yet been adjusted for an applicable requirement that became effective during the PAL effective period, as required under paragraph (b)(xv)(J)(V) of this section, such distribution shall be made as if the PAL had been adjusted.

(2.) The Division shall decide whether and how the PAL-allowable emissions will be distributed and issue a revised permit incorporating allowable limits for each emissions unit, or each group of emissions units, as the Division determines is appropriate.

(II) Each emissions unit(s) shall comply with the allowable emission limitation on a 12-month rolling basis. The Division may approve the use of monitoring systems (source testing, emission factors, etc.) other than CEMS, CERMS, PEMS or CPMS to demonstrate compliance with the allowable emission limitation.

(III) Until the Division issues the revised permit incorporating allowable limits for each emissions unit, or each group of emissions units, as required under paragraph (b)(xv)(I)(I)(2.) of this section, the source shall continue to comply with a source-wide, multi-unit emissions cap equivalent to the level of the PAL emission limitation.

(IV) Any physical change or change in the method of operation at the major stationary source will be subject to Chapter 6, Section 4 requirements if such change meets the definition of “Major modification” in Section 4(a).

(V) The major stationary source owner or operator shall continue to comply with any State of Wyoming or Federal applicable requirements (BACT, RACT, NSPS, etc.) that may have applied either during the PAL effective period or prior to the PAL effective period except for those emission limitations that had been established pursuant to paragraph (b)(i)(G) of this section, but were eliminated by the PAL in accordance with the provisions in paragraph (b)(xv)(A)(II)(3.) of this section.

(J) Renewal of a PAL.

(I) The Division shall follow the procedures specified in paragraph (b)(xv)(E) of this section in approving any request to renew a PAL for a major stationary source, and shall provide both the proposed PAL level and a written rationale for the proposed PAL level to the public for review and comment. During such public review, any person may propose a PAL level for the source for consideration by the Division.

(II) Application Deadline. A major stationary source owner or operator shall submit a timely application to the Division to request renewal of a PAL. A timely application is one that is submitted at least 6 months prior to, but not

earlier than 18 months from, the date of permit expiration. This deadline for application submittal is to ensure that the permit will not expire before the permit is renewed. If the owner or operator of a major stationary source submits a complete application to renew the PAL within this time period, then the PAL shall continue to be effective until the revised permit with the renewed PAL is issued.

(III) Application Requirements. The application to renew a PAL permit shall contain the information required in paragraphs (b)(xv)(J)(III)(1.) through (4.) of this section.

(1.) The information required in paragraphs (b)(xv)(C)(I) through (III) of this section.

(2.) A proposed PAL level.

(3.) The sum of the potential to emit of all emissions units under the PAL (with supporting documentation).

(4.) Any other information the owner or operator wishes the Division to consider in determining the appropriate level for renewing the PAL.

(IV) PAL Adjustment. In determining whether and how to adjust the PAL, the Division shall consider the options outlined in paragraphs (b)(xv)(J)(IV)(1.) and (2.) of this section; however, in no case may any such adjustment fail to comply with paragraph (b)(xv)(J)(IV)(3.) of this section.

(1.) If the emissions level calculated in accordance with paragraph (b)(xv)(F) of this section is equal to or greater than 80 percent of the PAL level, the Division may renew the PAL at the same level without considering the factors set forth in paragraph (b)(xv)(J)(IV)(2.) of this section; or

(2.) The Division may set the PAL at a level that it determines to be more representative of the source's baseline actual emissions, or that it determines to be appropriate considering air quality needs, advances in control technology, anticipated economic growth in the area, desire to reward or encourage the source's voluntary emissions reductions, or other factors as specifically identified by the Division in its written rationale.

(3.) Notwithstanding paragraphs (b)(xv)(J)(IV)(1.) and (2.) of this section:

a. If the potential to emit of the major stationary source is less than the PAL, the Division shall adjust the PAL to a level no greater than the potential to emit of the source; and

b. The Division shall not approve a renewed PAL level higher than the current PAL, unless the major stationary source has complied with the provisions of paragraph (b)(xv)(K) of this section (increasing a PAL).

(V) If the compliance date for a State of Wyoming or Federal requirement that applies to the PAL source occurs during the PAL effective period, and if the Division has not already adjusted for such requirement, the PAL shall be adjusted at the time of PAL permit renewal or Chapter 6, Section 3 operating permit renewal, whichever occurs first.

(K) Increasing a PAL During the PAL Effective Period.

(I) The Division may increase a PAL emission limitation only if the major stationary source complies with the provisions in paragraphs (b)(xv)(K)(I)(1.) through (4.) of this section.

(1.) The owner or operator of the major stationary source shall submit a complete application to request an increase in the PAL limit for a PAL major modification. Such application shall identify the emissions unit(s) contributing to the increase in emissions so as to cause the major stationary source's emissions to equal or exceed its PAL.

(2.) As part of this application, the major stationary source owner or operator shall demonstrate that the sum of the baseline actual emissions of the small emissions units, plus the sum of the baseline actual emissions of the significant and major emissions units assuming application of BACT equivalent controls, plus the sum of the allowable emissions of the new or modified emissions unit(s), exceeds the PAL. The level of control that would result from BACT equivalent controls on each significant or major emissions unit shall be determined by conducting a new BACT analysis at the time the application is submitted, unless the emissions unit is currently required to comply with a BACT or LAER requirement that was established within the preceding 10 years. In such a case, the assumed control level for that emissions unit shall be equal to the level of BACT or LAER with which that emissions unit must currently comply.

(3.) The owner or operator obtains a Chapter 6, Section 4 permit for all emissions unit(s) identified in paragraph (b)(xv)(K)(I)(1.) of this section, regardless of the magnitude of the emissions increase resulting from them (that is, no significant levels apply). These emissions unit(s) shall comply with any emissions

requirements resulting from the Chapter 6, Section 4 process (for example, BACT), even though they have also become subject to the PAL or continue to be subject to the PAL.

(4.) The PAL permit shall require that the increased PAL level shall be effective on the day any emissions unit that is part of the PAL major modification becomes operational and begins to emit the PAL pollutant.

(II) The Division shall calculate the new PAL as the sum of the allowable emissions for each modified or new emissions unit, plus the sum of the baseline actual emissions of the significant and major emissions units (assuming application of BACT equivalent controls as determined in accordance with paragraph (b)(xv)(K)(I)(2.) of this section), plus the sum of the baseline actual emissions of the small emissions units.

(III) The PAL permit shall be revised to reflect the increased PAL level pursuant to the public notice requirements of paragraph (b)(xv)(E) of this section.

(L) Monitoring Requirements for PALs.

(I) General Requirements.

(1.) Each PAL permit must contain enforceable requirements for the monitoring system that accurately determines plantwide emissions of the PAL pollutant in terms of mass per unit of time. Any monitoring system authorized for use in the PAL permit must be based on sound science and meet generally acceptable scientific procedures for data quality and manipulation. Additionally, the information generated by such system must meet minimum legal requirements for admissibility in a judicial proceeding to enforce the PAL permit.

(2.) The PAL monitoring system must employ one or more of the four general monitoring approaches meeting the minimum requirements set forth in paragraphs (b)(xv)(L)(II)(1.) through (4.) of this section and must be approved by the Division.

(3.) Notwithstanding paragraph (b)(xv)(L)(I)(2.) of this section, you may also employ an alternative monitoring approach that meets paragraph (b)(xv)(L)(I)(1.) of this section if approved by the Division.

(4.) Failure to use a monitoring system that meets the requirements of this section renders the PAL invalid.

(II) Minimum Performance Requirements For Approved Monitoring Approaches. The following are acceptable general monitoring approaches

when conducted in accordance with the minimum requirements in paragraphs (b)(xv)(L)(III) through (IX) of this section:

(1.) Mass balance calculations for activities using coatings or solvents;

(2.) CEMS;

(3.) CPMS or PEMS; and

(4.) Emission factors.

(III) Mass Balance Calculations. An owner or operator using mass balance calculations to monitor PAL pollutant emissions from activities using coating or solvents shall meet the following requirements:

(1.) Provide a demonstrated means of validating the published content of the PAL pollutant that is contained in or created by all materials used in or at the emissions unit;

(2.) Assume that the emissions unit emits all of the PAL pollutant that is contained in or created by any raw material or fuel used in or at the emissions unit, if it cannot otherwise be accounted for in the process; and

(3.) Where the vendor of a material or fuel, which is used in or at the emissions unit, publishes a range of pollutant content from such material, the owner or operator must use the highest value of the range to calculate the PAL pollutant emissions unless the Division determines there is site-specific data or a site-specific monitoring program to support another content within the range.

(IV) CEMS. An owner or operator using CEMS to monitor PAL pollutant emissions shall meet the following requirements:

(1.) CEMS must comply with applicable Performance Specifications found in 40 CFR part 60, Appendix B; and

(2.) CEMS must sample, analyze, and record data at least every 15 minutes while the emissions unit is operating.

(V) CPMS or PEMS. An owner or operator using CPMS or PEMS to monitor PAL pollutant emissions shall meet the following requirements:

(1.) The CPMS or the PEMS must be based on current site-specific data demonstrating a correlation between the monitored parameter(s) and the PAL pollutant emissions across the range of operation of the emissions unit; and

(2.) Each CPMS or PEMS must sample, analyze, and record data at least every 15 minutes, or at another less frequent interval approved by the Division, while the emissions unit is operating.

(VI) Emission Factors. An owner or operator using emission factors to monitor PAL pollutant emissions shall meet the following requirements:

(1.) All emission factors shall be adjusted, if appropriate, to account for the degree of uncertainty or limitations in the factors' development;

(2.) The emissions unit shall operate within the designated range of use for the emission factor, if applicable; and

(3.) If technically practicable, the owner or operator of a significant emissions unit that relies on an emission factor to calculate PAL pollutant emissions shall conduct validation testing to determine a site-specific emission factor within 6 months of PAL permit issuance, unless the Division determines that testing is not required.

(VII) A source owner or operator must record and report maximum potential emissions without considering enforceable emission limitations or operational restrictions for an emissions unit during any period of time that there is no monitoring data, unless another method for determining emissions during such periods is specified in the PAL permit.

(VIII) Notwithstanding the requirements in paragraphs (b)(xv)(L)(III) through (VIII) of this section, where an owner or operator of an emissions unit cannot demonstrate a correlation between the monitored parameter(s) and the PAL pollutant emissions rate at all operating points of the emissions unit, the Division shall, at the time of permit issuance:

(1.) Establish default value(s) for determining compliance with the PAL based on the highest potential emissions reasonably estimated at such operating point(s); or

(2.) Determine that operation of the emissions unit during operating conditions when there is no correlation between monitored parameter(s) and the PAL pollutant emissions is a violation of the PAL.

(IX) Re-validation. All data used to establish the PAL pollutant must be re-validated through performance testing or other scientifically valid means approved by the Division. Such testing must occur at least once every 5 years after issuance of the PAL.

(M) Recordkeeping Requirements.

(I) The PAL permit shall require an owner or operator to retain a copy of all records necessary to determine compliance with any requirement of paragraph (b)(xv) of this section and of the PAL, including a determination of each emissions unit's 12-month rolling total emissions, for 5 years from the date of such record.

(II) The PAL permit shall require an owner or operator to retain a copy of the following records, for the duration of the PAL effective period plus 5 years:

(1.) A copy of the PAL permit application and any applications for revisions to the PAL; and

(2.) Each annual certification of compliance pursuant to Chapter 6, Section 3 and the data relied on in certifying the compliance.

(N) Reporting and Notification Requirements. The owner or operator shall submit semi-annual monitoring reports and prompt deviation reports to the Division in accordance with the applicable Chapter 6, Section 3 operating permit program. The reports shall meet the requirements in paragraphs (b)(xv)(N)(I) through (III) of this section.

(I) Semi-annual Report. The semi-annual report shall be submitted to the Division within 30 days of the end of each reporting period. This report shall contain the information required in paragraphs (b)(xv)(N)(I)(1.) through (7.) of this section.

(1.) The identification of owner and operator and the permit number.

(2.) Total annual emissions (tons/year) based on a 12-month rolling total for each month in the reporting period recorded pursuant to paragraph (b)(xv)(M)(I) of this section.

(3.) All data relied upon, including, but not limited to, any Quality Assurance or Quality Control data, in calculating the monthly and annual PAL pollutant emissions.

(4.) A list of any emissions units modified or added to the major stationary source during the preceding 6-month period.

(5.) The number, duration, and cause of any deviations or monitoring malfunctions (other than the time associated with zero and span calibration checks), and any corrective action taken.

(6.) A notification of a shutdown of any monitoring system, whether the shutdown was permanent or temporary, the reason for the shutdown, the anticipated date that the monitoring system will be fully operational or replaced with another monitoring system, and whether the emissions unit monitored by the monitoring system continued to operate, and the calculation of the emissions of the pollutant or the number determined by method included in the permit, as provided by paragraph (b)(xv)(L)(VII) of this section.

(7.) A signed statement by the responsible official (as defined by the applicable Chapter 6, Section 3 operating permit program) certifying the truth, accuracy, and completeness of the information provided in the report.

(II) Deviation Report. The major stationary source owner or operator shall promptly submit reports of any deviations or exceedance of the PAL requirements, including periods where no monitoring is available. A report submitted pursuant to Chapter 6, Section 3(h)(i)(C)(III)(2.) shall satisfy this reporting requirement. The deviation reports shall be submitted within the time limits prescribed by Chapter 6, Section 3(h)(i)(C)(III)(2.). The reports shall contain the following information:

(1.) The identification of owner and operator and the permit number;

(2.) The PAL requirement that experienced the deviation or that was exceeded;

(3.) Emissions resulting from the deviation or the exceedance; and

(4.) A signed statement by the responsible official (as defined by the applicable Chapter 6, Section 3 operating permit program) certifying the truth, accuracy, and completeness of the information provided in the report.

(III) Re-validation Results. The owner or operator shall submit to the Division the results of any re-validation test or method within three months after completion of such test or method.

(O) Transition Requirements.

(I) The Division shall not issue a PAL that does not comply with the requirements in paragraphs (b)(xv)(A) through (O) of this section after the Administrator has approved regulations incorporating these requirements into Chapter 6, Section 4.

(II) The Division may supersede any PAL which was established prior to the date of approval of this regulation by the Administrator of EPA with a PAL that complies with the requirements of paragraphs (b)(xv)(A) through (O) of this section.

(xvi) If any provision of this section, or the application of such provision to any person or circumstance, is held invalid, the remainder of this section, or the application of such provision to persons or circumstances other than those as to which it is held invalid, shall not be affected thereby.

(xvii) Transition:

(A) The requirements for BACT in Chapter 6, Section 4(b)(ii) and the requirements for air quality analysis in Chapter 6, Section 4(b)(i) shall not apply to a major stationary source or major modification that was subject to Chapter 6, Section 4, as effective on January 25, 1979, if the owner or operator of the source submitted an application for a permit under these regulations before August 7, 1980, and the Administrator subsequently determines that the application submitted before that date was complete. Instead, the requirements of Chapter 6, Section 4 as in effect on January 25, 1979, apply to any such source or modification.

(B) The requirements for air quality monitoring in paragraph (b)(i)(E) shall not apply to a particular source or modification that was subject to Chapter 6, Section 4, as effective on January 25, 1979, if the owner or operator of the source or modification submits an application for a permit under these regulations on or before June 8, 1981, and the Administrator subsequently determines that the application submitted before that date was complete with respect to the requirements for ambient air quality data analyses as in effect on January 25, 1979. Instead, the latter requirements shall apply to such source or modification.

(C) The requirements for air quality monitoring in paragraph (b)(i)(E) shall not apply to a particular source or modification that was not subject to Chapter 6, Section 4, as effective on January 25, 1979, if the owner or operator of the source or modification submits an application for a permit under these regulations before June 8, 1981, and the Administrator subsequently determines that the application as submitted before that date was complete except with respect to the requirements in paragraph (b)(i)(F).

(D) The requirements for air quality monitoring for PM₁₀ in paragraphs (b)(i)(E)(I) through (IV) of this section, effective February 13, 1989, shall not apply to a particular source or modification, if the owner or operator of the source or modification submits an application for a permit under Chapter 6, Section 4 on or before June 1, 1988 and the Administrator subsequently determines that the application submitted before that date was complete, except with respect to the requirements for monitoring particulate matter.

(E) The requirements for air quality monitoring of PM₁₀ in paragraphs (b)(i)(E)(IV) through (b)(i)(E)(V) of this section, effective February 13, 1989, shall apply to a particular source or modification if the owner or operator of the source or modification submits an application for a permit under this section after June 1, 1988 and no later than December 1, 1988. The data shall have been gathered over at least the period from February 1, 1988 to the date the application becomes otherwise complete in accordance with the provisions set forth under paragraph (b)(xvii)(G) of this section, except that the Administrator may provide that the monitoring period specification may be reduced to a minimum of four months if he is satisfied that a complete and adequate analysis can be accomplished with monitoring data gathered over that shorter period of time.

(F) For any application under this section that becomes complete except as to the requirements of paragraphs (b)(i)(E)(III) and (b)(i)(E)(IV) pertaining to PM₁₀, after December 1, 1988 and no later than August 1, 1989, the data that paragraph (b)(i)(E)(III) requires will have been gathered over at least the period from August 1, 1988 to the date the application becomes otherwise complete. The Administrator may provide that the monitoring period specification may be reduced to a minimum of four months if he is satisfied that a complete and adequate analysis can be accomplished with monitoring data gathered over that shorter period of time.

(G) With respect to any requirements for air quality monitoring of PM₁₀ specified under paragraphs (b)(xvii)(D) and (b)(xvii)(E) of this section, effective February 13, 1989, the owner or operator of the source or modification shall use a monitoring method approved by the Administrator and shall estimate the ambient concentrations of PM₁₀ using the data collected by such approved monitoring method in accordance with estimating procedures approved by the Administrator.

(H) The requirement to demonstrate compliance with the maximum allowable increment for nitrogen dioxide shall not apply to a major stationary source or major modification that was subject to Chapter 6, Section 4, as effective on February 8, 1988, if the owner or operator of the source or modification submits an application for a permit under these regulations on or before October 30, 1990 and the Administrator subsequently determines that the application submitted before that date was complete.

(I) The requirement to demonstrate compliance with the maximum allowable increment for PM₁₀ shall not apply to a major stationary source or major modification that was subject to Chapter 6, Section 4, as effective on June 3, 1993, if the owner or operator of the source or modification submits an application for a permit under these regulations on or before the effective date of this regulation revision and the Administrator subsequently determines that the application submitted before that date was complete. Instead, the requirement to demonstrate compliance with the maximum allowable increment for TSP, as in effect at the time the application was submitted, shall apply:

Maximum Allowable Increments of Deterioration - µg/m³

<u>Pollutant</u>	<u>Class I</u>	<u>Class II</u>
Particulate Matter:		
TSP, Annual geometric mean	5	19
TSP, 24-hour maximum*	10	37

*Maximum allowable increment may be exceeded once per year at any receptor site.

(c) All national parks, national wilderness areas, and national memorial parks in Wyoming as of January 25, 1979, shall be designated Class I and may not be redesignated. All other areas of the State of Wyoming shall be designated Class II as of the effective date of this regulation.

(d) Redesignation. All redesignation of areas within the State of Wyoming shall be accomplished through the process of establishment of Standards and Regulations set forth in the Wyoming Environmental Quality Act.

(i) The following areas may be redesignated only as Class I or Class II Areas:

(A) An area which exceeds 10,000 acres in size and is a national monument, a national primitive area, a national preserve, a national recreational area, a national wild and scenic river, a national wildlife refuge, a national lakeshore, and

(B) A national park or national wilderness area which exceeds 10,000 acres in size and is established after the effective date of this regulation.

(ii) Except as provided in paragraph (c) above, any area may be redesignated as Class I or II, with the approval of the Administrator of the Environmental Protection Agency, in accordance with the provisions of paragraph (iii) below; provided, however, that lands within the exterior boundaries of reservations of federally recognized

Indian tribes may be redesignated to any class, but only by the appropriate Indian governing body.

(iii) (A) At least one public hearing must be held in accordance with the provisions for adoption of regulations as set forth in the Administrative Procedures Act and the Wyoming Environmental Quality Act.

(B) At least 30 days prior to the public hearing, a description and analysis of the health, environmental, economic, social and energy effects of the proposed redesignation shall be prepared and made available for public inspection. Any person petitioning the Department or Council to redesignate an area shall be responsible for preparing or submitting such description and analysis. Such persons shall also be responsible for revising this required documentation to the extent necessary to satisfy the Administrator of the U.S. EPA. The notice of the public hearing shall contain appropriate notification of the availability of the description and analysis of the proposed redesignation.

(C) Agencies from neighboring states, Indian governing bodies, Federal Land Managers, and local governments whose land may be affected by the proposed redesignation shall be notified at least 30 days prior to the hearing.

(D) Prior to proposing a redesignation, the Division and the Air Quality Advisory Board shall consult with the elected leadership of local and other substate general purpose governments in the area covered by the redesignation.

(E) Prior to public notice of the proposed redesignation the Division shall provide written notice to any Federal Land Manager who may be responsible for any federal lands within the area proposed for such redesignation and shall afford adequate opportunity (but not in excess of 60 days) to confer with the State respecting the intended notice of designation. The Federal Land Manager shall be offered the opportunity to submit written comments and recommendations with respect to such intended notice of redesignation. In redesignating any area with respect to which the federal land manager has submitted written comments and recommendations, the Division will publish a list of any inconsistency between such redesignation and such recommendation with an explanation of such inconsistency (together with the reasons for making such redesignation against the recommendation of the Federal Land Manager).

(F) The Council shall review and examine the description and analysis prepared pursuant to subparagraph (iii)(B) above prior to any redesignation.

(iv) (A) If an area has been proposed for redesignation to a more stringent class, no permit to construct may be granted to a source which may cause an impact in the area proposed for redesignation and for which an application to construct is received by the Division after the filing of the petition for redesignation with the

Environmental Quality Council until the proposed redesignation has been acted upon; however, approval may be granted if, in the Administrator's judgment, the proposed source would not violate the applicable increments of the proposed redesignation. Such approval shall be withheld only so long as in the Administrator's judgment, the petitioner is expeditiously proceeding toward development of the "description and analysis" required under (iii)(B) above, and provided that such "description and analysis" is complete and submitted to the Council for action on the petition within 18 months of the filing of the initial petition. Upon good cause shown, the Council may extend the foregoing deadline.

(B) Where an application for a permit to construct a source has been received by the Division prior to the receipt by the Council of a petition for redesignation of an area to a more stringent class and where such source may cause an impact in the area proposed for redesignation, the permit application shall be processed considering the classification of an area which existed at the time of permit application. For purposes of establishing a priority date under this Chapter 6, Section 4(d)(vi)(B), (1) such permit application is not required to meet the provisions for completeness in Chapter 6, Section 2, and (2) the time frames in Chapter 6, Section 2(g) for action on applications shall not apply.

However, a priority date established under Chapter 6, Section 4(d)(vi)(B), shall remain in effect only so long as in the Administrator's judgment, the applicant is expeditiously proceeding toward the development and submittal of such other information and data as required to make the application complete under the provisions of Chapter 6, Section 2, and provided that such other information and data is submitted to, and judged to be complete by the Administrator within 18 months of the filing of the initial permit application. Upon good cause shown, the Administrator may extend the foregoing deadline.

Section 5. Permit requirements for construction and modification of NESHAPs sources.

(a) (i) Applicability.

(A) This section implements the preconstruction review requirements of section 112(i)(1) for sources subject to a relevant emission standard that has been promulgated under Chapter 5, Section 3. In addition, this subsection includes other requirements for constructed and reconstructed stationary sources that are or become subject to a relevant promulgated emission standard.

(B) After the effective date of a relevant standard, the requirements in this subsection apply to owners or operators who construct a new source or reconstruct a source after the proposal date of that standard. New or reconstructed sources that start up before the standard's effective date are not subject to the

preconstruction review requirements specified in paragraphs (ii)(B), (iii), and (iv) of this subsection.

(ii) Requirements for Existing, Newly Constructed, and Reconstructed Sources.

(A) Upon construction an affected source is subject to relevant standards for new sources, including compliance dates. Upon reconstruction, an affected source is subject to relevant standards for new sources, including compliance dates, irrespective of any change in emissions of hazardous air pollutants from that source.

(B) After the effective date of any relevant standard, no person may construct a new major affected source or reconstruct a major affected source subject to such standard, or reconstruct a major source such that the source becomes a major affected source subject to the standard, without obtaining written approval, in advance, from the Administrator in accordance with the procedures specified in paragraphs (iii) and (iv) of this subsection.

(C) After the effective date of any relevant standard, no person may construct a new affected source or reconstruct an affected source subject to such standard, or reconstruct a source such that the source becomes an affected source subject to the standard, without notifying the Administrator of the intended construction or reconstruction. The notification shall be submitted in accordance with the procedures in Chapter 5, Section 3(k)(ii) and shall include all the information required for an application for approval of construction or reconstruction as specified in paragraph (iii) of this subsection. For major sources, the application for approval of construction or reconstruction may be used to fulfill the notification requirements of this subparagraph.

(D) After the effective date of any relevant standard, no person may operate such source without complying with the provisions of this section and the relevant standard unless that person has received an extension of compliance or an exemption from compliance under Chapter 5, Section 3(h)(viii) or Section 3(h)(ix).

(E) After the effective date of any relevant standard, equipment added (or a process change) to an affected source that is within the scope of the definition of affected source under the relevant standard shall be considered part of the affected source and subject to all provisions of the relevant standard established for that affected source. If a new affected source is added to the facility, the new affected source shall be subject to all the provisions of the relevant standard that are established for new sources including compliance dates.

(iii) Application for Approval of Construction or Reconstruction. The provisions of this paragraph implement section 112(i)(1) of the Act.

(A) General Application Requirements.

(I) An owner or operator who is subject to the requirements of paragraph (ii)(B) of this subsection shall submit to the Administrator an application for approval of the construction of a new major affected source, the reconstruction of a major affected source, or the reconstruction of a major source such that the source becomes a major affected source subject to the standard. The application shall be submitted in accordance with Chapter 6, Section 2 requirements before the construction or reconstruction is planned to commence. The application for approval of construction or reconstruction may be used to fulfill the initial notification requirements of Chapter 5, Section 3(k)(ii)(E). The owner or operator may submit the application for approval well in advance of the date construction or reconstruction is planned to commence in order to ensure a timely review by the Administrator and that the planned commencement date will not be delayed.

(II) A separate application shall be submitted for each construction or reconstruction. Each application for approval of construction or reconstruction shall include at a minimum:

- (1.) The applicant's name and address;
- (2.) A notification of intention to construct a new major affected source or make any physical or operational change to a major affected source that may meet or has been determined to meet the criteria for a reconstruction, as defined in Chapter 5, Section 3(e);
- (3.) The address (i.e., physical location) or proposed address of the source;
- (4.) An identification of the relevant standard that is the basis of the application;
- (5.) The expected commencement date of the construction or reconstruction;
- (6.) The expected completion date of the construction or reconstruction;
- (7.) The anticipated date of (initial) startup of the source;
- (8.) The type and quantity of hazardous air pollutants emitted by the source, reported in units and averaging times and in accordance with the test methods specified in the relevant standard, or if actual emissions data are not

yet available, an estimate of the type and quantity of hazardous air pollutants expected to be emitted by the source reported in units and averaging times specified in the relevant standard. The owner or operator may submit percent reduction information if a relevant standard is established in terms of percent reduction. However, operating parameters, such as flow rate, shall be included in the submission to the extent that they demonstrate performance and compliance; and

(9.) Other information as specified in paragraphs (iii)(B) and (iii)(C) of this subsection.

(III) An owner or operator who submits estimates or preliminary information in place of the actual emissions data and analysis required in paragraphs (iii)(A)(II)(8.) and (iii)(B) of this subsection shall submit the actual, measured emissions data and other correct information as soon as available but not later than with the notification of compliance status required in Chapter 5, Section 3(k)(viii) [see Chapter 5, Section 3(k)(viii)(D)].

(B) Application for Approval of Construction. Each application for approval of construction shall include, in addition to the information required in paragraph (iii)(A)(II) of this subsection, technical information describing the proposed nature, size, design, operating design capacity, and method of operation of the source, including an identification of each point of emission for each hazardous air pollutant that is emitted (or could be emitted) and a description of the planned air pollution control system (equipment or method) for each emission point. The description of the equipment to be used for the control of emissions shall include each control device for each hazardous air pollutant and the estimated control efficiency (percent) for each control device. The description of the method to be used for the control of emissions shall include an estimated control efficiency (percent) for that method. Such technical information shall include calculations of emission estimates in sufficient detail to permit assessment of the validity of the calculations. An owner or operator who submits approximations of control efficiencies under this subparagraph shall submit the actual control efficiencies as specified in paragraph (iii)(A)(III) of this subsection.

(C) Application for Approval of Reconstruction. Each application for approval of reconstruction shall include, in addition to the information required in paragraph (iii)(A)(II) of this subsection:

(I) A brief description of the affected source and the components that are to be replaced;

(II) A description of present and proposed emission control systems (i.e., equipment or methods). The description of the equipment to be used for the control of emissions shall include each control device for each hazardous air pollutant and the estimated control efficiency (percent) for each control device. The description of

the method to be used for the control of emissions shall include an estimated control efficiency (percent) for that method. Such technical information shall include calculations of emission estimates in sufficient detail to permit assessment of the validity of the calculations;

(III) An estimate of the fixed capital cost of the replacements and of constructing a comparable entirely new source;

(IV) The estimated life of the affected source after the replacements; and

(V) A discussion of any economic or technical limitations the source may have in complying with relevant standards or other requirements after the proposed replacements. The discussion shall be sufficiently detailed to demonstrate to the Administrator's satisfaction that the technical or economic limitations affect the source's ability to comply with the relevant standard and how they do so.

(VI) If in the application for approval of reconstruction the owner or operator designates the affected source as a reconstructed source and declares that there are no economic or technical limitations to prevent the source from complying with all relevant standards or other requirements, the owner or operator need not submit the information required in subparagraphs (iii)(C)(III) through (V) of this subsection, above.

(D) Additional Information. The Administrator may request additional relevant information after the submittal of an application for approval of construction or reconstruction.

(iv) Approval of Construction or Reconstruction.

(A) (I) If the Administrator determines that, if properly constructed, or reconstructed, and operated, a new or existing source for which an application under paragraph (iii) of this subsection was submitted will not cause emissions in violation of the relevant standard(s) and any other federally enforceable requirements, the Administrator will approve the construction or reconstruction through issuance of a construction or reconstruction permit for the source.

(II) In addition, in the case of reconstruction, the Administrator's determination under this paragraph will be based on:

(1.) The fixed capital cost of the replacements in comparison to the fixed capital cost that would be required to construct a comparable entirely new source;

(2.) The estimated life of the source after the replacements compared to the life of a comparable entirely new source;

(3.) The extent to which the components being replaced cause or contribute to the emissions from the source; and

(4.) Any economic or technical limitations on compliance with relevant standards that are inherent in the proposed replacements.

(B) (I) The Administrator will notify the owner or operator in writing of approval or intention to deny approval of construction or reconstruction within 60 calendar days after receipt of sufficient information to evaluate an application submitted under paragraph (iii) of this subsection. The 60-day approval or denial period will begin after the owner or operator has been notified in writing that the application is complete. The Administrator will notify the owner or operator in writing of the status of the application, that is, whether the application contains sufficient information to make a determination, within 30 calendar days after receipt of the original application and within 30 calendar days after receipt of any supplementary information that is submitted.

(II) When notifying the owner or operator that the application is not complete, the Administrator will specify the information needed to complete the application and provide notice of opportunity for the applicant to present, in writing, within 30 calendar days after notification of the incomplete application, additional information or arguments to the Administrator to enable further action on the application.

(C) Before denying any application for approval of construction or reconstruction, the Administrator will notify the applicant of the Administrator's intention to issue the denial together with:

(I) Notice of the information and findings on which the intended denial is based; and

(II) Notice of opportunity for the applicant to present, in writing, within 30 calendar days after notification of the intended denial, additional information or arguments to the Administrator to enable further action on the application.

(D) A final determination to deny any application for approval will be in writing and will specify the ground on which the denial is based. The final determination will be made within 60 calendar days of presentation of additional information or arguments (if the application is complete), or within 60 calendar days after the final date specified for presentation if no presentation is made.

(E) Neither the submission of an application for approval nor the Administrator's approval of construction or reconstruction shall:

(I) Relieve an owner or operator of legal responsibility for compliance with any applicable provisions of this section or with any other applicable Federal, State, or local requirement; or

(II) Prevent the Administrator from implementing or enforcing this section or taking any other action under the Wyoming Environmental Quality Act.

(v) Approval of Construction or Reconstruction Based on Prior State Preconstruction Review.

(A) The Administrator may approve an application for construction or reconstruction specified in paragraphs (ii)(B) and (iii) of this section if the owner or operator of a new or reconstructed source who is subject to such requirement demonstrates to the Administrator's satisfaction that the following conditions have been (or will be) met:

(I) The owner or operator of the new or reconstructed source has undergone a preconstruction review and approval process under Chapter 6, Section 2 before the promulgation date of the relevant standard and has received a federally enforceable construction permit that contains a finding that the source will meet the relevant emission standard as proposed, if the source is properly built and operated;

(II) In making its finding, the State has considered factors substantially equivalent to those specified in paragraph (iv)(A) of this section; and either

(III) The promulgated standard is no more stringent than the proposed standard in any relevant aspect that would affect the Administrator's decision to approve or disapprove an application for approval of construction or reconstruction under this section; or

(IV) The promulgated standard is more stringent than the proposed standard but the owner or operator will comply with the standard as proposed during the 3-year period immediately following the effective date of the standard as allowed for in Chapter 5, Section 3(h)(ii)(C).

(B) The owner or operator shall submit to the Administrator the request for approval of construction or reconstruction under this paragraph no later than the application deadline specified in paragraph (iii)(A) of this section [see also Chapter 5, Section 3(k)(ii)(B)]. The owner or operator shall include in the request information sufficient for the Administrator's determination. The Administrator will evaluate the

owner or operator's request in accordance with the procedures specified in paragraph (iv) of this section. The Administrator may request additional relevant information after the submittal of a request for approval of construction or reconstruction under this paragraph.

Section 6. Permit requirements for case-by-case maximum achievable control technology (MACT) determination.

(a) Applicability. The requirements of this section carry out section 112(g)(2)(B) of the Clean Air Act, as amended in 1990.

(b) Overall Requirements. The requirements of this section apply to any owner or operator who constructs or reconstructs a major source of hazardous air pollutants after the effective date of this section unless the major source in question has been specifically regulated or exempted from regulation under a standard issued pursuant to section 112(d), section 112(h), or section 112(j) and incorporated in 40 CFR part 63 or Chapter 5, Section 3, or the owner or operator of such major source has received all necessary air quality permits for such construction or reconstruction project before the effective date of this section.

(c) Exclusion for Electric Utility Steam Generating Units. The requirements of this section do not apply to electric utility steam generating units unless and until such time as these units are added to the source category list pursuant to section 112(c)(5) of the Act.

(d) Exclusion for Stationary Sources in Deleted Source Categories. The requirements of this section do not apply to stationary sources that are within a source category that has been deleted from the source category list pursuant to section 112(c)(9) of the Act.

(e) Exclusion for Research and Development Activities. The requirements of this section do not apply to research and development activities, as defined in Chapter 6, Section 6(f)(xiii).

(f) Definitions:

Terms used in this section that are not defined in this section have the meaning given to them in the Act and in Chapter 5, Section 3.

(i) ***"Affected source"*** means the stationary source or group of stationary sources which, when fabricated (on site), erected, or installed meets the definition of "construct a major source" or the definition of "reconstruct a major source" contained in this section.

(ii) ***"Affected States"*** are all States:

(A) Whose air quality may be affected and that are contiguous to the State of Wyoming where a MACT determination is made in accordance with this Section; or

(B) Whose air quality may be affected and that are within 50 miles of the major source for which a MACT determination is made in accordance with this section.

(iii) **“Available information”** means, for purposes of identifying control technology options for the affected source, information contained in the following information sources as of the date of approval of the MACT determination by the Division:

(A) A relevant proposed regulation, including all supporting information;

(B) Background information documents for a draft or proposed regulation;

(C) Data and information available for the EPA Control Technology Center developed pursuant to section 113 of the Act;

(D) Data and information contained in the EPA Aerometric Informational Retrieval System including information in the MACT data base;

(E) Any additional information that can be expeditiously provided by EPA; and

(F) For the purpose of determinations by the Division, any additional information provided by the applicant or others, and any additional information considered available by the Division.

(iv) **“Construct a major source”** means:

(A) To Fabricate, erect, or install at any greenfield site a stationary source or group of stationary sources which is located within a contiguous area and under common control and which emits or has the potential to emit 10 tons per year of any HAPs or 25 tons per year of any combination of HAP, or

(B) To fabricate, erect, or install at any developed site a new process or production unit which in and of itself emits or has the potential to emit 10 tons per year of any HAP or 25 tons per year of any combination of HAP, unless the process or production unit satisfies criteria in paragraphs (B)(I) through (VI) of this definition.

(I) All HAP emitted by the process or production unit that would otherwise be controlled under the requirements of this section will be controlled by emission control equipment which was previously installed at the same site as the process or production unit;

(II) (1.) The Division has determined within a period of 5 years prior to the fabrication, erection, or installation of the process or production unit that the existing emission control equipment represented best available control technology (BACT), toxics-best available control technology (T-BACT), under Chapter 6, Section 2, or MACT based on State air toxic rules for the category of pollutants which includes those HAPs to be emitted by the process or production unit; or

(2.) The Division determines that the control of HAP emissions provided by the existing equipment will be equivalent to that level of control currently achieved by other well-controlled similar sources (i.e., equivalent to the level of control that would be provided by a current BACT, T-BACT, or State air toxic rule MACT determination);

(III) The Division determines that the percent control efficiency for emissions of HAP from all sources to be controlled by the existing control equipment will be equivalent to the percent control efficiency provided by the control equipment prior to the inclusion of the new process or production unit;

(IV) The Division has provided notice and an opportunity for public comment concerning its determination that criteria in paragraphs (B)(I), (B)(II), and (B)(III) of this definition apply and concerning the continued adequacy of any prior BACT, T-BACT, or State air toxic rule MACT determination;

(V) If any commenter has asserted that a prior BACT, T-BACT, or State air toxic rule MACT determination is no longer adequate, the Division has determined that the level of control required by that prior determination remains adequate; and

(VI) Any emission limitations, work practice requirements, or other terms and conditions upon which the above determinations by the Division are applicable requirements under Chapter 6, Section 3 and either have been incorporated into any existing operating permit for the affected facility or will be incorporated into such permit upon issuance.

(v) **“Control technology”** means measures, processes, methods, systems, or techniques to limit the emission of hazardous air pollutants through process changes, substitution of materials or other modifications;

- (A) Reduce the quantity of, or eliminate emissions of, such pollutants through process changes, substitution of materials or other modifications;
- (B) Enclose systems or processes to eliminate emissions;
- (C) Collect, capture or treat such pollutants when released from a process, stack, storage or fugitive emissions point;
- (D) Are design, equipment, work practice, or operational standards (including requirements for operator training or certification) as provided in 42 U.S.C. 7412(h); or
- (E) Are a combination of paragraphs (A) through (D) of this definition.

(vi) ***“Electric utility steam generating unit”*** means any fossil fuel fired combustion unit of more than 25 megawatts that serves a generator that produces electricity for sale. A unit that co-generates steam and electricity and supplies more than one-third of its potential electric output capacity and more than 25 megawatts electric output to any utility power distribution system for sale shall be considered an electric utility steam generating unit.

(vii) ***“Greenfield site”*** means a contiguous area under common control that is an undeveloped site.

(viii) ***“List of Source Categories”*** means the Source Category List required by section 112(c) of the Act.

(ix) ***“Maximum achievable control technology (MACT) emission limitation for new sources”*** means the emission limitation which is not less stringent than the emission limitation achieved in practice by the best controlled similar source, and which reflects the maximum degree of reduction in emissions that the Division, taking into consideration the cost of achieving such emission reduction, and any non-air quality health and environmental impacts and energy requirements, determines is achievable by the constructed or reconstructed major source.

(x) ***“Notice of MACT Approval”*** means a Chapter 6, Section 2 permit issued by a Division containing all federally enforceable conditions necessary to enforce the application and operation of MACT or other control technologies such that the MACT emission limitation is met.

(xi) ***“Process or production unit”*** means any collection of structures and/or equipment, that processes, assembles, applies, or otherwise uses material inputs to

produce or store an intermediate or final product. A single facility may contain more than one process or production unit.

(xii) **“Reconstruct a major source”** means the replacement of components at an existing process or production unit that in and of itself emits or has the potential to emit 10 tons per year of any HAP or 25 tons per year of any combination of HAP, whenever:

(A) The fixed capital cost of the new components exceeds 50 percent of the fixed capital cost that would be required to construct a comparable process or production unit; and

(B) It is technically and economically feasible for the reconstructed major source to meet the applicable maximum achievable control technology emission limitation for new sources established under this section.

(xiii) **“Research and development activities”** means activities conducted at a research or laboratory facility whose primary purpose is to conduct research and development into new processes and products, where such source is operated under the close supervision of technically trained personnel and is not engaged in the manufacture of products for sale or exchange for commercial profit, except in a de minimis manner.

(xiv) **“Similar source”** means a stationary source or process that has comparable emissions and is structurally similar in design and capacity to a constructed or reconstructed major source such that the source could be controlled using the same control technology.

(g) Prohibition. After the effective date of this section no person may begin actual construction or reconstruction of a major source of HAP unless:

(i) The major source in question has been specifically regulated or exempted from regulation under a standard issued pursuant to section 112(d), section 112(h) or section 112(j) in 40 CFR part 63, and the owner and operator has fully complied with all procedures and requirements for preconstruction review established by that standard, including any applicable requirements set forth in Chapter 6, Section 5; or

(ii) The Division has made a final and effective case-by-case determination pursuant to the provisions of Chapter 6, Section 6(h) such that emissions from the constructed or reconstructed major source will be controlled to a level no less stringent than the maximum achievable control technology emission limitation for new sources.

(h) Maximum Achievable Control Technology (MACT) Determinations for Constructed and Reconstructed Major Sources.

(i) Applicability. The requirements of this section apply to an owner or operator who constructs or reconstructs a major source of HAP subject to a case-by-case determination of maximum achievable control technology pursuant to Chapter 6, Section 6(g).

(ii) Requirements for Constructed and Reconstructed Major Sources. When a case-by-case determination of MACT is required by Chapter 6, Section 6(g), the owner and operator shall obtain from the Division an approved MACT determination in conjunction with the required Chapter 6, Section 2 permit according to the requirements listed in Chapter 6, Section 6(h)(iv).

(iii) Principles of MACT Determinations. The following general principles shall govern preparation by the owner or operator of each permit application or other application requiring a case-by-case MACT determination concerning construction or reconstruction of a major source, and all subsequent review of and actions taken concerning such an application by the Division:

(A) The MACT emission limitation or MACT requirements recommended by the applicant and approved by the Division shall not be less stringent than the emission control which is achieved in practice by the best controlled similar source, as determined by the Division.

(B) Based upon available information, as defined in this section, the MACT emission limitation and control technology (including any requirements under Chapter 6, Section 6(h)(iii)(C)) recommended by the applicant and approved by the Division shall achieve the maximum degree of reduction in emissions of HAP which can be achieved by utilizing those control technologies that can be identified from the available information, taking into consideration the costs of achieving such emission reduction and any non-air quality health and environmental impacts and energy requirements associated with the emission reduction.

(C) The applicant may recommend a specific design, equipment, work practice, or operational standard, or a combination thereof, and the Division may approve such a standard if the Division specifically determines that it is not feasible to prescribe or enforce an emission limitation under the criteria set forth in section 112(h)(2) of the Act.

(D) If EPA has either proposed a relevant emission standard pursuant to section 112(d) or section 112(h) of the Act or adopted a presumptive MACT determination for the source category which includes the constructed or reconstructed major source, then the MACT requirements applied to the constructed or reconstructed major source shall have considered those MACT emission limitations and requirements of the proposed standard or presumptive MACT determination.

(iv) Application Requirements for a Case-By-Case MACT Determination.

(A) An application for a MACT determination, in conjunction with an application for a permit pursuant to Chapter 6, Section 2, shall specify a control technology selected by the owner or operator that, if properly operated and maintained, will meet the MACT emission limitation or standard as determined according to the principles set forth in Chapter 6, Section 6(h)(iii).

(B) In each instance where a constructed or reconstructed major source would require additional control technology or a change in control technology, the application for a MACT determination shall contain the following information:

(I) The name and address (physical location) of the major source to be constructed or reconstructed;

(II) A brief description of the major source to be constructed or reconstructed and identification of any listed source category or categories in which it is included;

(III) The expected commencement date for the construction or reconstruction of the major source;

(IV) The expected completion date for construction or reconstruction of the major source;

(V) The anticipated date of start-up for the constructed or reconstructed major source;

(VI) The HAP emitted by the constructed or reconstructed major source, and the estimated emission rate for each such HAP, to the extent this information is needed by the Division to determine MACT;

(VII) Any federally enforceable emission limitations applicable to the constructed or reconstructed major source;

(VIII) The maximum and expected utilization of capacity of the constructed or reconstructed major source, and the associated uncontrolled emission rates for that source, to the extent this information is needed by the Division to determine MACT;

(IX) The controlled emissions for the constructed or reconstructed major source in tons/yr at expected and maximum utilization of capacity, to the extent this information is needed by the Division to determine MACT;

(X) A recommended emission limitation for the constructed or reconstructed major source consistent with the principles set forth in paragraph (iii) of this section;

(XI) The selected control technology to meet the recommended MACT emission limitation, including technical information on the design, operation, size, estimated control efficiency of the control technology (and the manufacturer's name, address, telephone number, and relevant specifications and drawings, if requested by the Division);

(XII) Supporting documentation including identification of alternative control technologies considered by the applicant to meet the emission limitation, and analysis of cost and non-air quality health environmental impacts or energy requirements for the selected control technology; and

(XIII) Any other relevant information required pursuant to Section 33.

(C) In each instance where the owner or operator contends that a constructed or reconstructed major source will be in compliance, upon startup, with case-by-case MACT under this section without a change in control technology, the application for a MACT determination shall contain the following information:

(I) The information described in Chapter 6, Section 6(h)(iv)(B)(I) through (iv)(B)(X); and

(II) Documentation of the control technology in place.

(v) Administrative Procedures for Review of the Notice of MACT Approval.

(A) The administrative procedures for review shall follow the procedures specified in Chapter 6, Section 2(g) for the permit review and approval or denial process.

(vi) Notice of MACT Approval.

(A) The Notice of MACT Approval will contain a MACT emission limitation (or a MACT work practice standard if the Division determines it is not feasible to prescribe or enforce an emission standard) to control the emissions of HAP. The MACT emission limitation or standard will be determined by the Division and will conform to the principles set forth in Chapter 6, Section 6(h)(iii) of this section.

(B) The Notice of MACT Approval will specify any notification, operation and maintenance, performance testing, monitoring, reporting and recordkeeping requirements. The Notice of MACT Approval shall include:

(I) In addition to the MACT emission limitation or MACT work practice standard established under this section, additional emission limits, production limits, operational limits or other terms and conditions necessary to ensure Federal enforceability of the MACT emission limitation;

(II) Compliance certifications, testing, monitoring, reporting and recordkeeping requirements that are consistent with the requirements of Chapter 6, Section 3(h);

(III) In accordance with section 114(a)(3) of the Act, monitoring shall be capable of demonstrating continuous compliance during the applicable reporting period. Such monitoring data shall be of sufficient quality to be used as a basis for enforcing all applicable requirements established under this section, including emission limitations;

(IV) A statement requiring the owner or operator to comply with all applicable requirements contained in Chapter 5, Section 3 and Chapter 6, Section 5;

(C) All provisions contained in the Notice of MACT Approval shall be federally enforceable upon the effective date of issuance of such notice, as provided by Chapter 6, Section 6(h)(ix).

(D) The Notice of MACT Approval shall expire if construction or reconstruction has not commenced within 18 months of issuance, unless the Division has granted an extension which shall not exceed an additional 12 months.

(vii) Opportunity for Public Comment on the Notice of MACT Approval.

(A) The opportunity for public comment shall follow the procedures specified in Chapter 6, Section 2(m) for the permit review and approval process.

(viii) EPA Notification. The Division shall send a copy of the final Notice of MACT Approval issued pursuant to Chapter 6, Section 2 and this section to the EPA through the appropriate Regional Office, and to all other State and local air pollution control agencies having jurisdiction in affected States.

(ix) Effective Date. The effective date of a MACT determination shall be the date of issuance of the Chapter 6, Section 2 permit to construct or reconstruct.

(x) Compliance Date. On and after the date of start-up, a constructed or reconstructed major source which is subject to the requirements of this section shall be in compliance with all applicable requirements specified in the MACT determination.

(xi) Compliance With MACT Determinations.

(A) An owner or operator of a constructed or reconstructed major source that is subject to a MACT determination shall comply with all requirements in the final Notice of MACT Approval, including but not limited to any MACT emission limitation or MACT work practice standard, and any notification, operation and maintenance, performance testing, monitoring, reporting, and recordkeeping requirements.

(B) An owner or operator of a constructed or reconstructed major source which has obtained a MACT determination shall be deemed to be in compliance with Chapter 6, Section 6(g) only to the extent that the constructed or reconstructed major source is in compliance with all requirements set forth in the final Notice of MACT Approval issued pursuant to Chapter 6, Section 2 and this section. Any violation of such requirements by the owner or operator shall be deemed by the Division and by EPA to be a violation of the prohibition on construction or reconstruction in Chapter 6, Section 6(g) for whatever period the owner or operator is determined to be in violation of such requirements, and shall subject the owner or operator to appropriate enforcement action.

(xii) Reporting to EPA. Within 60 days of the issuance of a final Notice of MACT Approval issued pursuant to Chapter 6, Section 2 and this section, the Division shall provide a copy of such notice to the Administrator, and shall provide a summary in a compatible electronic format for inclusion in the MACT data base.

(i) Requirements for Constructed or Reconstructed Major Sources Subject to a Subsequently Promulgated MACT Standard or MACT Requirement.

(i) If EPA promulgates an emission standard under section 112(d) or section 112(h) of the Act or the Division issues a determination under section 112(j) of the Act that is applicable to a stationary source or group of sources which would be deemed to be a constructed or reconstructed major source under this section before the date that the owner or operator has obtained a final and legally effective MACT determination pursuant to Chapter 6, Section 6(h), the owner or operator of the source(s) shall comply with the promulgated standard or determination rather than any MACT determination under this section by the Division, and the owner or operator shall comply with the promulgated standard by the compliance date in the promulgated standard.

(ii) If EPA promulgates an emission standard under section 112(d) or section 112(h) of the Act or the Division makes a determination under section 112(j) of the Act that is applicable to a stationary source or group of sources which was deemed to

be a constructed or reconstructed major source under this section and has been subject to a prior case-by-case MACT determination pursuant to Chapter 6, Section 6(h), and the owner and operator obtained a final and legally effective case-by-case MACT determination prior to the promulgation date of such emission standard, then the Division shall (if the initial operating permit has not yet been issued) issue an initial operating permit which incorporates the emission standard or determination, or shall (if the initial operating permit has been issued) revise the operating permit according to the reopening procedures in Chapter 6, Section 3(d)(vii) to incorporate the emission standard or determination.

(A) The EPA may include in the emission standard established under section 112(d) or section 112(h) of the Act a specific compliance date for those sources which have obtained a final and legally effective MACT determination under this section and which have submitted the information required by Chapter 6, Section 6(h) to the EPA before the close of the public comment period for the standard established under section 112(d) of the Act. Such date shall assure that the owner or operator shall comply with the promulgated standard as expeditiously as practicable, but not longer than 8 years after such standard is promulgated. In that event, the Division shall incorporate the applicable compliance date in the Chapter 6, Section 3 operating permit.

(B) If no compliance date has been established in the promulgated 112(d) or 112(h) standard or section 112(j) determination, for those sources which have obtained a final and legally effective MACT determination under this section, then the Division shall establish a compliance date in the Chapter 6, Section 3 operating permit that assures that the owner or operator shall comply with the promulgated standard or determination as expeditiously as practicable, but not longer than 8 years after such standard is promulgated or a section 112(j) determination is made.

(iii) Notwithstanding the requirements of paragraphs (i) and (ii) of this section, if EPA promulgates an emission standard under section 112(d) or section 112(h) of the Act or the Division issues a determination under section 112(j) of the Act that is applicable to a stationary source or group of sources which was deemed to be a constructed or reconstructed major source under this section and which is the subject of a prior case-by-case MACT determination pursuant to subsection (h), and the level of control required by the emission standard issued under section 112(d) or section 112(h) or the determination issued under section 112(j) is less stringent than the level of control required by any emission limitation or standard in the prior MACT determination, the Division is not required to incorporate any less stringent terms of the promulgated standard in the Chapter 6, Section 3 operating permit applicable to such source(s) and may in its discretion consider any more stringent provisions of the prior MACT determination to be applicable legal requirements when issuing or revising such an operating permit.

Section 7. Clean air resource allocation expiration.

(a) (i) Any owner or operator of a facility which ceases operation shall not be entitled to the continued use of the clean air resource necessary to accommodate the emissions from such facility if such cessation of operation extends beyond a day 5 years after the date of cessation of such operation.

(ii) Within 60 days after determining that a facility has ceased operation, the Administrator shall notify in writing the affected owner or operator that this section is applicable. The notice shall further advise the owner or operator of the proposed expiration date for the facility's entitlement to use its allocated air resource and provide the operator or owner the opportunity to review the Administrator's decision.

Within 60 days after receiving the notice, the owner or operator of the facility shall notify the Administrator if it intends to operate the facility in the future. Failure to so notify the Administrator will constitute a rebuttable presumption that the owner or operator has permanently and purposefully ceased operation of the facility with no intent to operate in the future. The continuous five-year period shall not begin earlier than 60 days prior to receipt by the owner or operator of the notice from the Administrator.

(iii) Prior to revoking an air allocation, the Administrator shall provide notice to the affected owner or operator and if requested by the owner or operator will hold a public hearing pursuant to Chapter III of the Rules of Practice and Procedure of the Department on the impending expiration of the entitlement to use the allocated clean air resource. Said notice shall be served no later than six months prior to the proposed expiration date. The Administrator's decision issued as a result of the Chapter III hearing may be appealed to the Environmental Quality Council in the manner set forth in the Environmental Quality Act and the applicable rules and regulations.

(iv) The Administrator may extend the 5-year time period for non-use upon a satisfactory showing that the owner or operator intends and can demonstrate firm plans to operate the facility in the future.

(v) The transfer of ownership of a facility shall not affect the entitlement for use by the facility of the clean air resource. Such a transfer of ownership does not extend the expiration date defined in paragraph (a)(i).

(vi) For purposes of this section "operation" means to function in a manner which directly contributes to the accomplishment of the primary purpose of the facility. The definition of operation of a mining facility shall include: (i) all of the primary activities associated with mining, such as ore and overburden removal, topsoil stripping and haulage, reclamation and associated construction activities, and (ii) activities and commitments accepted by the Department as "interim stabilization" measures which qualify the mine for "temporary cessation and a resultant extension of

reclamation obligations” under the regulations of the Land Quality Division of the Department.

(b) (i) In a case where an owner or operator permanently and purposefully ceases operation with no expressed intent to operate the facility in the future, the associated clean air resource allocation is not reserved to the owner or operator and immediately reverts to the state.

(ii) Prior to such revocation the Administrator shall provide notice to the affected owner or operator and if requested by such owner or operator will hold a public hearing pursuant to Chapter III of the Rules of Practice and Procedure of the Department.

(c) Start-up and operation of a facility after a period of non-use which lasts at least 5 years shall be considered to represent the operation of a new facility and shall be subject to the permit requirements of Chapter 6, Section 2. The provisions of Chapter 6, Section 4 may also be applicable.

(d) Brief periods of facility operation which are clearly designed to circumvent the intent of this section shall not be considered as operation under the provisions of subsections (a) and (b) above. For purposes of this section, operation must be for commercial purposes (which does not include temporary operation for period testing or maintenance of the facility in a standby status).

Section 8. **[Reserved.]**

Section 9. **Best available retrofit technology (BART).**

(a) Applicability. The provisions of this regulation apply to existing stationary facilities, as defined in Section 9(b) of this chapter.

(b) Definitions.

“Adverse impact on visibility” means visibility impairment which interferes with the management, protection, preservation, or enjoyment of the visitor’s visual experience of the Federal Class I area. This determination must be made on a case-by-case basis taking into account the geographic extent, intensity, duration, frequency and time of visibility impairments, and how these factors correlate with 1) times of visitor use of the Federal Class I area, and 2) the frequency and timing of natural conditions that reduce visibility. This term does not include effects on integral vistas.

“Applicable technology” means a commercially available control option that has been or is soon to be deployed (e.g., is specified in a permit) on the same or a similar source type or a technology that has been used on a pollutant-bearing gas stream that is the same or similar to the gas stream characteristics of the source.

“Available technology” means that a technology is licensed and available through commercial sales.

“Average cost effectiveness” means the total annualized costs of control divided by annual emissions reductions (the difference between baseline annual emissions and the estimate of emissions after controls). For the purposes of calculating average cost effectiveness, baseline annual emissions means a realistic depiction of anticipated annual emissions for the source. The source or the Division may use State or Federally enforceable permit limits or estimate the anticipated annual emissions based upon actual emissions from a representative baseline period.

“BART alternative” means an alternative measure to the installation, operation, and maintenance of BART that will achieve greater reasonable progress toward national visibility goals than would have resulted from the installation, operation, and maintenance of BART at BART-eligible sources within industry source categories subject to BART requirements.

“Best available retrofit technology (BART)” means an emission limitation based on the degree of reduction achievable through the application of the best system of continuous emission reduction for each pollutant that is emitted by an existing stationary facility. The emission limitation must be established, on a case-by-case basis, taking into consideration the technology available, the costs of compliance, the energy and non air quality environmental impacts of compliance, any pollution control equipment in use or in existence at the source or unit, the remaining useful life of the source or unit, and the degree of improvement in visibility which may reasonably be anticipated to result from the use of such technology.

“Deciview” means a measurement of visibility impairment. A deciview is a haze index derived from calculated light extinction, such that uniform changes in haziness correspond to uniform incremental changes in perception across the entire range of conditions, from pristine to highly impaired. The deciview haze index is calculated based on the following equation (for the purposes of calculating deciview, the atmospheric light extinction coefficient must be calculated from aerosol measurements):

$$\text{Deciview haze index} = 10 \ln_e (b_{\text{ext}}/10 \text{ Mm}^{-1})$$

Where b_{ext} = the atmospheric light extinction coefficient, expressed in inverse megameters (Mm^{-1}).

“Existing stationary facility” means any of the following stationary sources of air pollutants, including any reconstructed source, which was not in operation prior to August 7, 1962, and was in existence on August 7, 1977, and has the potential to emit 250 tons per year or more of any visibility impairing air pollutant. In determining potential to emit, fugitive emissions, to the extent quantifiable, must be counted.

(i) Fossil fuel-fired steam electric plants of more than 250 million British thermal units (BTU) per hour heat input that generate electricity for sale.

(A) Boiler capacities shall be aggregated to determine the heat input of a plant.

(B) Includes plants that co-generate steam and electricity and combined cycle turbines.

(ii) Coal cleaning plants (thermal dryers).

(iii) Kraft pulp mills.

(iv) Portland cement plants.

(v) Primary zinc smelters.

(vi) Iron and steel mill plants.

(vii) Primary aluminum ore reduction plants.

(viii) Primary copper smelters.

(ix) Municipal incinerators capable of charging more than 250 tons of refuse per day.

(x) Hydrofluoric, sulfuric, and nitric acid plants.

(xi) Petroleum refineries.

(xii) Lime plants.

(xiii) Phosphate rock processing plants. Includes all types of phosphate rock processing facilities, including elemental phosphorous plants as well as fertilizer production plants.

(xiv) Coke oven batteries.

(xv) Sulfur recovery plants.

(xvi) Carbon black plants (furnace process).

(xvii) Primary lead smelters.

(xviii) Fuel conversion plants.

(xix) Sintering plants.

(xx) Secondary metal production facilities. Includes nonferrous metal facilities included within Standard Industrial Classification code 3341, and secondary ferrous metal facilities in the category “iron and steel mill plants”.

(xxi) Chemical process plants. Includes those facilities within the 2-digit Standard Industrial Classification 28, including pharmaceutical manufacturing facilities.

(xxii) Fossil fuel boilers of more than 250 million BTUs per hour heat input.

(A) Individual boilers greater than 250 million BTU/hr, considering federally enforceable operational limits.

(B) Includes multi-fuel boilers that burn at least fifty percent fossil fuels.

(xxiii) Petroleum storage and transfer facilities with a capacity exceeding 300,000 barrels.

(A) 300,000 barrels refers to total facility-wide tank capacity for tanks put in place after August 7, 1962 and in existence on August 7, 1977.

(B) Includes gasoline and other petroleum-derived liquids.

(xxiv) Taconite ore processing facilities.

(xxv) Glass fiber processing plants.

(xxvi) Charcoal production facilities. Includes charcoal briquette manufacturing and activated carbon production.

“Incremental cost effectiveness” means the comparison of the costs and emissions performance level of a control option to those of the next most stringent option, as shown in the following formula:

$$\text{Incremental Cost Effectiveness (dollars per incremental ton removed)} = [(\text{Total annualized costs of control option}) - (\text{Total annualized costs of next control option})] \div [(\text{Next control option annual emissions}) - (\text{Control option annual emissions})]$$

“In existence” means that the owner or operator has obtained all necessary preconstruction approvals or permits required by Federal, State, or local air pollution emissions and air quality laws or regulations and either has 1) begun, or caused to begin, a continuous program of physical on-site construction of the facility or 2) entered into binding agreements or contractual obligations, which cannot be cancelled or modified without substantial loss to the owner or operator, to undertake a program of construction of the facility to be completed in a reasonable time.

“In operation” means engaged in activity related to the primary design function of the source.

“Integral vista” means a view perceived from within the mandatory Class I Federal area of a specific landmark or panorama located outside the boundary of the mandatory Class I Federal area.

“Natural conditions” means naturally occurring phenomena that reduce visibility as measured in terms of light extinction, visual range, contrast, or coloration.

“Plant” means all emissions units at a stationary source.

“Potential to emit” means the maximum capacity of a stationary source to emit a pollutant under its physical and operational design. Any physical or operational limitation on the capacity of the source to emit a pollutant including air pollution control equipment and restrictions on hours of operation or on the type or amount of material combusted, stored, or processed, shall be treated as part of its design if the limitation or the effect it would have on emissions is federally enforceable. Secondary emissions do not count in determining the potential to emit of a stationary source.

“Visibility-impairing air pollutant” includes the following:

- (i) Sulfur dioxide (SO₂);
- (ii) Nitrogen oxides (NO_x); and
- (iii) Particulate matter. (PM₁₀ will be used as the indicator for particulate matter. Emissions of PM₁₀ include the components of PM_{2.5} as a subset).

(c) Guidelines for BART Determinations.

(i) The U.S. Environmental Protection Agency regulations contained in 40 CFR part 51, Appendix Y, are incorporated by reference into these regulations. The specific documents containing the complete text of the regulations are found in 40 CFR part 51, Appendix Y, as published on July 6, 2005 in the Federal Register beginning on page 39104, not including later amendments. Copies of the July 6, 2005 materials can be

obtained from the Department of Environmental Quality, Division of Air Quality, 122 W. 25th Street, Cheyenne, Wyoming 82002.

(ii) The owner or operator of a fossil fuel-fired steam electric plant with a generating capacity greater than seven hundred fifty megawatts of electricity shall comply with the requirements of 40 CFR part 51, Appendix Y. All other facility owners or operators shall use Appendix Y as guidance for preparing their best available control retrofit technology determinations.

(d) Identification of Sources Subject to BART.

(i) Identification of sources subject to BART shall be performed by the Air Quality Division in accordance with EPA's guidelines for BART determinations under the regional haze rule 40 CFR part 51, Appendix Y, and incorporated by reference under Section 9(c). A BART-eligible source is subject to BART unless valid air quality dispersion modeling demonstrates that the source will not cause or contribute to visibility impairment in any Class I area.

(A) A single source that is responsible for a 1.0 deciview change or more is considered to "cause" visibility impairment in any Class I area.

(B) A single source that is responsible for a 0.5 deciview change or more is considered to "contribute" visibility impairment in any Class I area.

(C) A single source is exempt from BART if the 98th percentile daily change in visibility, as compared against natural background conditions, is less than 0.5 deciviews at all Class I federal areas for each year modeled and for the entire multi-year modeling period.

(ii) The Division will provide written notice to each source determined to be subject to BART.

(e) BART Requirements.

(i) Submission of Best Available Retrofit Technology (BART) Permit Application. The owner or operator of each source subject to BART as determined under Section 9(d), shall submit a BART permit application to the Division. The permit application shall be submitted according to a schedule determined by the Division. Sources with a potential to emit less than 40 tons per year SO₂ or NO_x or less than 15 tons per year PM₁₀ may exclude those de minimis level pollutants from the BART analysis. The BART permit application shall include:

(A) The name and address (physical location) of the existing stationary facility subject to BART.

(B) A brief description of the source and identification of any listed source categories in which it is included.

(C) Information on de minimis levels if pollutants are excluded from the analysis.

(D) An analysis of control options performed in accordance with 40 CFR part 51, Appendix Y, IV.

(E) A proposal and justification for BART emission limits and control technology that reflect the BART requirements established in 40 CFR part 51, Appendix Y.

(F) A description of the proposed emission control systems, including the estimated control efficiencies.

(G) A schedule to install and operate BART.

(H) Additional relevant information as the Administrator may request.

(ii) Administrative Procedures for Review of a BART Permit Application. The administrative procedures for review shall follow the procedures specified in Chapter 6, Section 2(g) of these regulations.

(iii) Proposed Permits. The Administrator shall prepare a proposed permit following the Division's review of the BART permit application. The Administrator may approve, or amend the proposed emission limits, BART technology, and compliance schedule. Any proposed permit shall specify any notification, operation and maintenance, performance testing, monitoring, reporting and recordkeeping requirements determined by the Administrator to be reasonable and necessary.

(iv) Opportunity for Public Comment. The opportunity for public comment shall follow the procedures specified in Chapter 6, Section 2(m) for permit review.

(v) Modifications to BART Permits. Any source seeking to modify the BART determination for that facility must obtain the Administrator's approval.

(vi) Operating Permit Requirements. BART requirements established pursuant to any BART permit issued under this section shall be included in a Chapter 6, Section 3 Operating Permit according to the procedures established in Chapter 6, Section 3.

(vii) Fees. Persons applying for a permit under this section shall pay a fee to cover the Department's cost of reviewing and acting on permit applications in accordance with Chapter 6, Section 2(o).

(viii) Installation of Best Available Retrofit Technology. The owner or operator of any source required to operate under a BART permit issued under Section 9(e)(iii), shall install and operate best available retrofit technology unless an alternative to the installation of BART as specified under Section 9(f) has been approved by the Division. Any control equipment required under a permit issued in this section shall be installed and operating as expeditiously as practicable but in no event later than five years after the United States Environmental Protection Agency's approval of Wyoming's State Implementation Plan revision for Regional Haze.

(ix) Operation and Maintenance of Best Available Retrofit Technology. The owner or operator of a facility required to install best available retrofit technology under Section 9(e)(viii) shall establish procedures to ensure such equipment is properly operated and maintained.

(f) BART Alternative.

(i) The Administrator may implement or require participation in an emissions trading program or other alternative measures developed in accordance with 40 CFR 51.308(e) rather than to require sources subject to BART to install, operate and maintain BART.

(g) Monitoring, Recordkeeping and Reporting. The owner or operator of any existing stationary facility that is required to install best available retrofit technology or an approved BART alternative shall conduct monitoring, recordkeeping and reporting sufficient to show compliance or noncompliance on a continuous basis.

Section 10. [Reserved.]

Section 11. [Reserved.]

Section 12. [Reserved.]

Section 13. Nonattainment permit requirements.

(a) 40 CFR part 51.165 is herein incorporated by reference, in its entirety, with the exception of paragraph (a) and paragraph (a)(1).

Section 14. Incorporation by reference.

(a) Code of Federal Regulations (CFR). All Code of Federal Regulations (CFRs) cited in this chapter, including their Appendices, revised and published as of July 1, 2008, not including any later amendments, are incorporated by reference. Copies of the Code of Federal Regulations are available for public inspection and copies can be obtained at cost from the Department of Environmental Quality, Division of Air Quality, 122 W. 25th Street, Cheyenne, Wyoming 82002. Copies of the CFRs can also be obtained at cost from Government Institutes, 15200 NBN Way, Building B, Blue Ridge Summit, PA 17214.

Section 4.	Incorporation by reference	5-126

**WYOMING DEPARTMENT OF ENVIRONMENTAL QUALITY
AIR QUALITY DIVISION
STANDARDS AND REGULATIONS**

National Emission Standards

CHAPTER 5

Section 1. Introduction to national emission standards.

(a) This Chapter incorporates emission control regulations developed by the Environmental Protection Agency for specific source categories. The State of Wyoming, Air Quality Division adopts these Federal Regulations in order to maintain administrative authority with regards to the standards. Section 2 contains New Source Performance Standards (NSPS) which regulate criteria pollutant emissions from specific categories of new sources. Section 3 contains National Emission Standards for Hazardous Air Pollutants (NESHAP) which regulates hazardous air pollutant emissions from specific categories of new and existing sources. Section 4 incorporates by reference all Code of Federal Regulations (CFRs), including their Appendices, cited in this Chapter and all American Society for Testing and Materials (ASTM) standards cited in this Chapter.

Section 2. New source performance standards.

(a) General: The U.S. Environmental Protection Agency regulations on Standards of Performance for New Stationary Sources, designated in Chapter 5, Section 2(b) and as amended by the word or phrase “substitutions” given in Chapter 5, Section 2(c), are incorporated into these regulations. The specific documents containing the complete text of the regulations are found in 40 CFR part 60.

(b) Designated Standards of Performance: The following Standards of Performance are incorporated by reference under Section 4(a) of this Chapter.

40 CFR part 60, Subpart D -	Standards of Performance for Fossil-Fuel-Fired Steam Generators for Which Construction is Commenced After August 17, 1971
40 CFR part 60, Subpart Da -	Standards of Performance for Electric Utility Steam Generating Units for Which Construction is Commenced After September 18, 1978
40 CFR part 60, Subpart Db -	Standards of performance for Industrial-Commercial-Institutional Steam Generating Units

40 CFR part 60, Subpart Dc -	Standards of Performance for Small Industrial-Commercial-Institutional Steam Generating Units
40 CFR part 60, Subpart E -	Standards of Performance for Incinerators
40 CFR part 60, Subpart Ea -	Standards of Performance for Municipal Waste Combustors for Which Construction is Commenced After December 20, 1989 and on or Before September 20, 1994
40 CFR part 60, Subpart Eb -	Standards of Performance for Large Municipal Waste Combustors for Which Construction is Commenced After September 20, 1994 or for Which Modification or Reconstruction is Commenced After June 19, 1996
40 CFR part 60, Subpart Ec -	Standards of Performance for Hospital/Medical/Infectious Waste Incinerators for Which Construction is Commenced After June 20, 1996
40 CFR part 60, Subpart F -	Standards of Performance for Portland Cement Plants
40 CFR part 60, Subpart G -	Standards of Performance for Nitric Acid Plants
40 CFR part 60, Subpart H -	Standards of Performance for Sulfuric Acid Plants
40 CFR part 60, Subpart I -	Standards of Performance for Hot Mix Asphalt Facilities
40 CFR part 60, Subpart J -	Standards of Performance for Petroleum Refineries
40 CFR part 60, Subpart Ja -	Standards of Performance for Petroleum Refineries for Which Construction, Reconstruction, or Modification Commenced After May 14, 2007

40 CFR part 60, Subpart K -	Standards of Performance for Storage Vessels for Petroleum Liquids for Which Construction, Reconstruction, or Modification Commenced After June 11, 1973, and Prior to May 19, 1978
40 CFR part 60, Subpart Ka -	Standards of Performance for Storage Vessels for Petroleum Liquids for Which Construction, Reconstruction, or Modification Commenced After May 18, 1978, and Prior to July 23, 1984
40 CFR part 60, Subpart Kb -	Standards of Performance for Volatile Organic Liquid Storage Vessels (Including Petroleum Liquid Storage Vessels) for Which Construction, Reconstruction, or Modification Commenced After July 23, 1984
40 CFR part 60, Subpart L -	Standards of Performance for Secondary Lead Smelters
40 CFR part 60, Subpart M -	Standards of Performance for Secondary Brass and Bronze Production Plants
40 CFR part 60, Subpart N -	Standards of Performance for Primary Emissions from Basic Oxygen Process Furnaces for Which Construction is Commenced After June 11, 1973
40 CFR part 60, Subpart Na -	Standards of Performance for Secondary Emissions from Basic Oxygen Process Steelmaking Facilities for Which Construction is Commenced After January 20, 1983
40 CFR part 60, Subpart O -	Standards of Performance for Sewage Treatment Plants
40 CFR part 60, Subpart P -	Standards of Performance for Primary Copper Smelters
40 CFR part 60, Subpart Q -	Standards of Performance for Primary Zinc Smelters

40 CFR part 60, Subpart R -	Standards of Performance for Primary Lead Smelters
40 CFR part 60, Subpart S -	Standards of Performance for Primary Aluminum Reduction Plants
40 CFR part 60, Subpart T -	Standards of Performance for the Phosphate Fertilizer Industry: Wet-Process Phosphoric Acid Plants
40 CFR part 60, Subpart U -	Standards of Performance for the Phosphate Fertilizer Industry: Superphosphoric Acid Plants
40 CFR part 60, Subpart V -	Standards of Performance for the Phosphate Fertilizer Industry: Diammonium Phosphate Plants
40 CFR part 60, Subpart W -	Standards of Performance for the Phosphate Fertilizer Industry: Triple Superphosphate Plants
40 CFR part 60, Subpart X -	Standards of Performance for the Phosphate Fertilizer Industry: Granular Triple Superphosphate Storage Facilities
40 CFR part 60, Subpart Y -	Standards of Performance for Coal Preparation Plants
40 CFR part 60, Subpart Z -	Standards of Performance for Ferroalloy Production Facilities
40 CFR part 60, Subpart AA -	Standards of Performance for Steel Plants: Electric Arc Furnaces Constructed After October 21, 1974 and on or Before August 17, 1983
40 CFR part 60, Subpart AAa -	Standards of Performance for Steel Plants: Electric Arc Furnaces and Argon-Oxygen Decarburization Vessels Constructed After August 17, 1983
40 CFR part 60, Subpart BB -	Standards of Performance for Kraft Pulp Mills

40 CFR part 60, Subpart CC -	Standards of Performance for Glass Manufacturing Plants
40 CFR part 60, Subpart DD -	Standards of Performance for Grain Elevators
40 CFR part 60, Subpart EE -	Standards of Performance for Surface Coating of Metal Furniture
40 CFR part 60, Subpart GG -	Standards of Performance for Stationary Gas Turbines
40 CFR part 60, Subpart HH -	Standards of Performance for Lime Manufacturing Plants
40 CFR part 60, Subpart KK -	Standards of Performance for Lead-Acid Battery Manufacturing Plants
40 CFR part 60, Subpart LL -	Standards of Performance for Metallic Mineral Processing Plants
40 CFR part 60, Subpart MM -	Standards of Performance for Automobile and Light-Duty Truck Surface Coating Operations
40 CFR part 60, Subpart NN -	Standards of Performance for Phosphate Rock Plants
40 CFR part 60, Subpart PP -	Standards of Performance for Ammonium Sulfate Manufacture
40 CFR part 60, Subpart QQ -	Standards of Performance for the Graphic Arts Industry: Publication Rotogravure Printing
40 CFR part 60, Subpart RR -	Standards of Performance for Pressure Sensitive Tape and Label Surface Coating Operations
40 CFR part 60, Subpart SS -	Standards of Performance for Industrial Surface Coating: Large Appliances
40 CFR part 60, Subpart TT -	Standards of Performance for Metal Coil Surface Coating

40 CFR part 60, Subpart UU -	Standards of Performance for Asphalt Processing and Asphalt Roofing Manufacture
40 CFR part 60, Subpart VV -	Standards of Performance for Equipment Leaks of VOC in the Synthetic Organic Chemicals Manufacturing Industry for Which Construction, Reconstruction, or Modification Commenced After January 5, 1981, and on or Before November 7, 2006
40 CFR part 60, Subpart VVa -	Standards of Performance for Equipment Leaks of VOC in the Synthetic Organic Chemicals Manufacturing Industry for Which Construction, Reconstruction, or Modification Commenced After November 7, 2006
40 CFR part 60, Subpart WW -	Standards of Performance for the Beverage Can Surface Coating Industry
40 CFR part 60, Subpart XX -	Standards of Performance for Bulk Gasoline Terminals
40 CFR part 60, Subpart AAA -	Standards of Performance for New Residential Wood Heaters
40 CFR part 60, Subpart BBB -	Standards of Performance for the Rubber Tire Manufacturing Industry
40 CFR part 60, Subpart DDD -	Standards of Performance for Volatile Organic Compound (VOC) Emissions from the Polymer Manufacturing Industry
40 CFR part 60, Subpart FFF -	Standards of Performance for Flexible Vinyl and Urethane Coating and Printing
40 CFR part 60, Subpart GGG -	Standards of Performance for Equipment Leaks of VOC in Petroleum Refineries for Which Construction, Reconstruction, or Modification Commenced After January 4, 1983, and on or Before November 7, 2006

40 CFR part 60, Subpart GGGa -	Standards of Performance for Equipment Leaks of VOC in Petroleum Refineries for Which Construction, Reconstruction, or Modification Commenced After November 7, 2006
40 CFR part 60, Subpart HHH -	Standards of Performance for Synthetic Fiber Production Facilities
40 CFR part 60, Subpart III -	Standards of Performance for Volatile Organic Compound (VOC) Emissions From the Synthetic Organic Chemical Manufacturing Industry (SOCMI) Air Oxidation Unit Processes
40 CFR part 60, Subpart JJJ -	Standards of Performance for Petroleum Dry Cleaners
40 CFR part 60, Subpart KKK -	Standards of Performance for Equipment Leaks of VOC From Onshore Natural Gas Processing Plants
40 CFR part 60, Subpart LLL -	Standards of Performance for Onshore Natural Gas Processing: SO ₂ Emissions
40 CFR part 60, Subpart NNN -	Standards of Performance for Volatile Organic Compound (VOC) Emissions From Synthetic Organic Chemical Manufacturing Industry (SOCMI) Distillation Operations
40 CFR part 60, Subpart OOO -	Standards of Performance for Nonmetallic Mineral Processing Plants
40 CFR part 60, Subpart PPP -	Standards of Performance for Wool Fiberglass Insulation Manufacturing Plants
40 CFR part 60, Subpart QQQ -	Standards of Performance for VOC Emissions From Petroleum Refinery Wastewater Systems
40 CFR part 60, Subpart RRR -	Standards of Performance for Volatile Organic Compound Emissions from Synthetic Organic Chemical Manufacturing Industry (SOCMI) Reactor Processes

40 CFR part 60, Subpart SSS -	Standards of Performance for Magnetic Tape Coating Facilities
40 CFR part 60, Subpart TTT -	Standards of Performance for Industrial Surface Coating: Surface Coating of Plastic Parts for Business Machines
40 CFR part 60, Subpart UUU -	Standards of Performance for Calciners and Dryers in Mineral Industries
40 CFR part 60, Subpart VVV -	Standards of Performance for Polymeric Coating of Supporting Substrates Facilities
40 CFR part 60, Subpart WWW -	Standards of Performance for Municipal Solid Waste Landfills
40 CFR part 60, Subpart AAAA -	Standards of Performance for Small Municipal Waste Combustion Units for Which Construction is Commenced After August 30, 1999 or for Which Modification or Reconstruction is Commenced After June 6, 2001
40 CFR part 60, Subpart CCCC -	Standards of Performance for Commercial and Industrial Solid Waste Incineration Units for Which Construction is Commenced After November 30, 1999 or for Which Modification or Reconstruction is Commenced on or After June 1, 2001
40 CFR part 60, Subpart EEEE -	Standards of Performance for Other Solid Waste Incineration Units for Which Construction is Commenced After December 9, 2004, or for Which Modification or Reconstruction is Commenced on or After June 16, 2006
40 CFR part 60, Subpart IIII -	Standards of Performance for Stationary Compression Ignition Internal Combustion Engines
40 CFR part 60, Subpart JJJJ -	Standards of Performance for Stationary Spark Ignition Internal Combustion Engines

40 CFR part 60, Subpart KKKK - Standards of Performance for Stationary Combustion Turbines

(i) Designated Appendices. The following appendices are incorporated by reference under Section 4(a) of this Chapter.

40 CFR part 60, Appendix A - Test Methods

40 CFR part 60, Appendix B - Performance Specifications

40 CFR part 60, Appendix C - Determination of Emission Rate Change

40 CFR part 60, Appendix D - Required Emission Inventory Information

40 CFR part 60, Appendix F - Quality Assurance Procedures

40 CFR part 60, Appendix I - Removable Label and Owner's Manual

(c) Word or Phrase Substitutions: In the standards designated in Chapter 5, Section 2(b) substitute:

- (i) Chapter 5, Section 2 for Subpart A
- (ii) Chapter 5, Section 2(h) for 60.8
- (iii) Chapter 5, Section 2(g) for 60.7
- (iv) Chapter 5, Section 2(m) for 60.18
- (v) Chapter 5, Section 2(e)(i) for 60.2
- (vi) Chapter 5, Section 2(e)(ii) for 60.3
- (vii) Chapter 5, Section 2(i) for 60.11
- (viii) Chapter 5, Section 2(j) for 60.13
- (ix) Chapter 5, Section 2(k) for 60.14
- (x) Chapter 5, Section 2(l) for 60.15
- (xi) Chapter 6, Section 2(b)(i) for 60.5 and 60.6
- (xii) Chapter 6, Section 2(i) for 60.7(a)(2) and (3)
- (xiii) Chapter 6, Section 2(j) for 60.8(a) and (d)
- (xiv) Section 35-11-1101 Environmental Quality Act for 60.9
- (xv) Chapter 1, Section 4 for 60.12
- (xvi) Chapter 5, Section 2(n) for 60.19

(d) Applicability: The provisions of Chapter 5, Section 2 are applicable to the owner or operator of any stationary source which contains an affected facility, the construction or modification of which is commenced after the date of publication of any proposed standard as designated in the applicable subparts of the Standards of Performance referenced in Chapter 5, Section 2(b) and contained in 40 CFR part 60.

(i) In addition to complying with the provisions of this section, the Owner or Operator of an affected facility may be required to obtain an operating permit issued to stationary sources by the Administrator pursuant to Title V of the Clean Air Act (Act) as amended November 15, 1990 (42 U.S.C. 7661). For more information about obtaining an operating permit see Chapter 6, Section 3.

(e) Definitions and Abbreviations: The following terms are explicitly defined for use in this section. As used in this section, all terms not defined herein shall have the meaning given to them in Chapter 1, Section 3.

(i) Definitions:

“Act” means the Clean Air Act (42 U.S.C. 7401 et seq.).

“Administrator” means the Administrator of the Division of Air Quality, Wyoming Department of Environmental Quality, except for those authorities which cannot be delegated to the state, in which case “administrator” means both the administrator of the Environmental Protection Agency and the Administrator of the Division of Air Quality, Wyoming Department of Environmental Quality.

“Affected facility” means, with reference to a stationary source, any apparatus to which a standard is applicable.

“Alternative method” means any method of sampling and analyzing for an air pollutant which is not a reference or equivalent method but which has been demonstrated to the Administrator’s satisfaction to, in some specific cases, produce results adequate for his determination of compliance.

“Capital expenditure” means an expenditure for a physical or operational change to an existing facility which exceeds the product of the applicable “annual asset guideline repair allowance percentage” specified in the latest edition of Internal Revenue Service (IRS) Publication 534 and the existing facility’s basis, as defined by section 1012 of the Internal Revenue Code. However, the total expenditure for a physical or operational change to an existing facility must not be reduced by any “excluded additions” as defined in IRS Publication 534, as would be done for tax purposes.

“Clean coal technology demonstration project” means a project using funds appropriated under the heading ‘Department of Energy-Clean Coal Technology’, up to a total amount of \$2,500,000,000 for commercial demonstrations of clean coal technology, or similar projects funded through appropriations for the Environmental Protection Agency.

“Commenced”, as applied to construction or modification of any new facility or source, means that the owner or operator has obtained a Construction Permit required by Chapter 6, Section 2 or either has (i) begun, or caused to begin, a continuous

program of physical on-site construction or modification of the facility or (ii) entered into binding agreements or contractual obligations, which cannot be canceled or modified without substantial loss to the owner or operator, to undertake a program of construction or modification of the facility to be completed within a reasonable time.

“Construction” means fabrication, erection, or installation of an affected facility.

“Continuous monitoring system” means the total equipment, required under the emission monitoring sections, used to sample and condition (if applicable), to analyze, and to provide a permanent record of emissions or process parameters.

“Electric utility steam generating unit” means any steam electric generating unit that is constructed for the purpose of supplying more than one-third of its potential electric output capacity and more than 25 MW electrical output to any utility power distribution system for sale. Any steam supplied to a steam distribution system for the purpose of providing steam to a steam-electric generator that would produce electrical energy for sale is also considered in determining the electrical energy output capacity of the affected facility.

“Equivalent method” means any method of sampling and analyzing for an air pollutant which has been demonstrated to the Administrator’s satisfaction to have a consistent and quantitatively known relationship to the reference method, under specified conditions.

“Excess emissions and monitoring systems performance report” is a report that must be submitted periodically by a source in order to provide data on its compliance with stated emission limits and operating parameters, and on the performance of its monitoring systems.

“Existing facility” means, with reference to a stationary source, any apparatus of the type for which a standard is promulgated in this section, and the construction or modification of which was commenced before the date of proposal of that standard; or any apparatus which could be altered in such a way as to be of that type.

“Isokinetic sampling” means sampling in which the linear velocity of the gas entering the sampling nozzle is equal to that of the undisturbed gas stream at the sample point.

“Issuance” of an operating permit will occur, in accordance with Chapter 6, Section 3.

“Malfunction” means any sudden, infrequent, and not reasonably preventable failure of air pollution control equipment, process equipment, or a process to

operate in a normal or usual manner. Failures that are caused in part by poor maintenance or careless operation are not malfunctions.

“Monitoring device” means the total equipment, required under the monitoring of operations sections, used to measure and record (if applicable) process parameters.

“Nitrogen oxides” means all oxides of nitrogen except nitrous oxide, as measured by test methods set forth in this part.

“One-hour period” means any 60-minute period commencing on the hour.

“Opacity” means the degree to which emissions reduce the transmission of light and obscure the view of an object in the background.

“Operating permit” or “part 70 permit” means any permit or group of permits covering a source under Chapter 6, Section 3 that is issued, renewed, amended or revised pursuant to Chapter 6, Section 3.

“Owner or operator” means any person who owns, leases, operates, controls, or supervises an affected facility or a stationary source of which an affected facility is a part.

“Particulate matter” means any finely divided solid or liquid material, other than uncombined water, as measured by the reference methods specified under each subpart, or an equivalent or alternative method.

“Permit program” means the comprehensive State operating permit system established pursuant to Title V of the Act (42 U.S.C. 7661) and regulations in Chapter 6, Section 3.

“Proportional sampling” means sampling at a rate that produces a constant ratio of sampling rate to stack gas flow rate.

“Reactivation of a very clean coal-fired electric utility steam generating unit” means any physical change or change in the method of operation associated with the commencement of commercial operations by a coal-fired utility unit after a period of discontinued operation where the unit:

(A) Has not been in operation for the two-year period prior to the enactment of the Clean Air Act amendments of 1990, and the emissions from such unit continue to be carried in the permitting authority’s emissions inventory at the time of enactment;

(B) Was equipped prior to shut-down with a continuous system of emissions control that achieves a removal efficiency for sulfur dioxide of no less than 85 percent and a removal efficiency for particulates of no less than 98 percent;

(C) Is equipped with low-NO_x burners prior to the time of commencement of operations following reactivation; and

(D) Is otherwise in compliance with the requirements of the Clean Air Act.

“Reference method” means any method of sampling and analyzing for an air pollutant as specified in the applicable subpart.

“Repowering” means replacement of an existing coal-fired boiler with one of the following clean coal technologies: atmospheric or pressurized fluidized bed combustion, integrated gasification combined cycle, magnetohydrodynamics, direct and indirect coal-fired turbines, integrated gasification fuel cells, or as determined by the Administrator of EPA, in consultation with the Secretary of Energy, a derivative of one or more of these technologies, and any other technology capable of controlling multiple combustion emissions simultaneously with improved boiler or generation efficiency and with significantly greater waste reduction relative to the performance of technology in widespread commercial use as of November 15, 1990. Repowering shall also include any oil and/or gas-fired unit which has been awarded clean coal technology demonstration funding as of January 1, 1991, by the Department of Energy.

“Run” means the net period of time during which an emission sample is collected. Unless otherwise specified, a run may be either intermittent or continuous within the limits of good engineering practice.

“Shutdown” means the cessation of operation of an affected facility for any purpose.

“Six-minute period” means any one of the 10 equal parts of a one-hour period.

“Standard” means a standard of performance proposed or promulgated under this part.

“Standard conditions” means a temperature of 293°K (68°F) and a pressure of 101.3 Kilopascals of Hg (29.92 in. of Hg).

“Start-up” means the setting in operation of an affected facility for any purpose.

“State” means the Wyoming Air Quality Division which has been delegated authority to implement:

- (A) The provisions of this section; and/or
- (B) The permit program established under 40 CFR part 70.

“Stationary source” means any building, structure, facility, or installation which emits or may emit any air pollutant.

“Volatile organic compounds” means any organic compound which participates in atmospheric photochemical reactions; or which is measured by a reference method, an equivalent method, an alternative method, or which is determined by procedures specified under any subpart.

(f) Permit Requirements: Compliance with the provisions of this section shall in no way relieve the owner or operator of responsibility for compliance with other applicable sections of these regulations. The permit requirements of Chapter 6, Section 2 are specifically applicable to affected facilities subject to the requirements of this section.

(g) Notification and Recordkeeping:

(i) Any owner or operator subject to the provisions of this section shall furnish the Administrator written notification as follows:

(A) A notification of the date construction (or reconstruction as defined under Chapter 1, Section 3) of an affected facility is commenced postmarked no later than 30 days after such date. This requirement shall not apply in the case of mass-produced facilities which are purchased in completed form.

(B) A notification of any physical or operational change to an existing facility which may increase the emission rate of any air pollutant to which a standard applies, unless that change is specifically exempted under an applicable subpart or in Chapter 5, Section 2(k). This notice shall be postmarked 60 days or as soon as practicable before the change is commenced and shall include information describing the precise nature of the change, present and proposed emission control systems, productive capacity of the facility before and after the change, and the expected completion date of the change. The Administrator may request additional relevant information subsequent to this notice.

(C) A notification of the date upon which demonstration of the continuous monitoring system performance commences in accordance with Chapter 5, Section 2(j)(iii). Notification shall be postmarked not less than 30 days prior to such date.

(D) A notification of the anticipated date for conducting the opacity observations required by Chapter 5, Section 2(i)(v) of this part. The notification shall be postmarked not less than 30 days prior to such date.

(E) A notification that continuous opacity monitoring system data results will be used to determine compliance with the applicable opacity standard during a performance test required by Chapter 5, Section 2(h) in lieu of Method 9 observation data as allowed by Chapter 5, Section 2(i)(v)(D). This notification shall be postmarked not less than 30 days prior to the date of the performance test.

(ii) Any owner or operator subject to the provisions of this part shall maintain records of the occurrence and duration of any start-up, shutdown, or malfunction in the operation of an affected facility; any malfunction of the air pollution control equipment; or any periods during which a continuous monitoring system or monitoring device is inoperative.

(iii) Each owner or operator required to install a continuous monitoring system (CMS) or monitoring device shall submit an excess emissions and monitoring systems performance report (excess emissions are defined in applicable subparts) and/or a summary report form (see paragraph E of this section) to the Administrator semiannually, except when: more frequent reporting is specifically required by an applicable subpart; or the CMS data are to be used directly for compliance determination, in which case quarterly reports shall be submitted; or the Administrator, on a case-by-case basis, determines that more frequent reporting is necessary to accurately assess the compliance status of the source. All reports shall be postmarked by the 30th day following the end of

each calendar half (or quarter, as appropriate). Written reports of excess emissions shall include the following information:

(A) The magnitude of excess emissions computed in accordance with Chapter 5, Section 2(j)(viii), any conversion factor(s) used, and the date and time of commencement and completion of each time period of excess emissions. The process operating time during the reporting period.

(B) Specific identification of each period of excess emissions that occurs during start-ups, shutdowns, malfunctions of the affected facility. The nature and cause of any malfunction (if known), the corrective action taken or preventative measures adopted.

(C) The date and time identifying each period during which the continuous monitoring system was inoperative except for zero and span checks and the nature of the system repairs or adjustments.

(D) When no excess emissions have occurred or the continuous monitoring system(s) have not been inoperative, repaired, or adjusted, such information shall be stated in the report.

(E) The summary report form shall contain the information and be in the format shown in Form B unless otherwise specified by the Administrator. One summary report form shall be submitted for each pollutant monitored at each affected facility.

(I) If the total duration of excess emissions for the reporting period is less than 1 percent of the total operating time for the reporting period and CMS downtime for the reporting period is less than 5 percent of the total operating time for the reporting period, only the summary report form shall be submitted and the excess emission report described in paragraph (iii) of this subsection need not be submitted unless requested by the Administrator.

(II) If the total duration of excess emissions for the reporting period is 1 percent or greater of the total operating time for the reporting period or the total CMS downtime for the reporting period is 5 percent or greater of the total operating time for the reporting period, the summary report form and the excess emission report described in paragraph (iii) of this subsection shall both be submitted.

Form B
EXCESS EMISSION SUMMARY REPORT

Emission Data Summary		CMS Performance Summary	
I. Duration of Excess Emissions in Reporting Period Due to:		I. CMS Downtime in Reporting Period Due to:	
A. Startup/Shutdown	_____	A. Monitor Equipment Malfunctions	_____
B. Control Equipment Problems	_____	B. Non-Monitor Equipment Malfunctions	_____
C. Process Problems	_____	C. Quality Assurance Calibration	_____
D. Other Known Causes	_____	D. Other Known Causes	_____
E. Unknown Causes	_____	E. Unknown Causes	_____
II. Total Duration of Excess Emission	_____	II. Total CMS Downtime	_____
III. Total Duration of Excess Emissions x 100 divided by Total Source Operating Time minus Total CMS Downtime	_____	III. Total CMS Downtime x 100 divided by Total Source Operating Time	_____

Total time of excess emission events due to emergency/abnormal operations _____.

NOTE:

1. Only report excess emissions which occur when the unit/process is operating. Include all excess emissions in the Emission Data Summary including those excess emissions associated with startup/shutdown and those excess emissions associated with Chapter 1, Section 5 (Emergency/Abnormal) operations. **Report times in hours for gaseous monitors and in tenths of an hour for opacity monitors.** Include detailed excess emission information and causes in the Excess Emission Table (Form C).
2. Only report CEM downtime which occurs while the unit/process is operating. **Report time in hours to one decimal point.** Include detailed CEM downtime and causes in the Monitor Outage Table (Form D).
3. Include an explanation of what corrective actions were taken for total excess emissions or monitor downtime for the quarter (Emission Data Summary and CMS Performance Summary, Item III) greater than 5%. **(See Instructions for further details.)**

On a separate page, describe any changes since last quarter in CMS, process or controls. I certify that the information contained in this report is true, accurate, and complete.

Name

Signature

Title

Date

(iv) (A) Notwithstanding the frequency of reporting requirements specified in paragraph (iii) of this subsection, an owner or operator who is required by an applicable subpart to submit excess emissions and monitoring systems performance reports (and summary reports) on a quarterly (or more frequent) basis may reduce the frequency of reporting for that standard to semiannual if the following conditions are met:

(I) For 1 full year (e.g., 4 quarterly or 12 monthly reporting periods) the affected facility's excess emissions and monitoring systems reports submitted to comply with a standard under this section continually demonstrate that the facility is in compliance with the applicable standard;

(II) The owner or operator continues to comply with all recordkeeping and monitoring requirements specified in this section and the applicable standard; and

(III) The Administrator does not object to a reduced frequency of reporting for the affected facility, as provided in paragraph (iv)(B) of this subsection.

(B) The frequency of reporting of excess emissions and monitoring systems performance (and summary) reports may be reduced only after the owner or operator notifies the Administrator in writing of the intent to make such a change and the Administrator does not object to the intended change. In deciding whether to approve a reduced frequency of reporting, the Administrator may review information concerning the source's entire previous performance history during the required recordkeeping period prior to the intended change, including performance test results, monitoring data, and evaluations of an owner or operator's conformance with operation and maintenance requirements. Such information may be used by the Administrator to make a judgment about the source's potential for noncompliance in the future. If the Administrator disapproves the owner or operator's request to reduce the frequency of reporting, the Administrator will notify the owner or operator in writing within 45 days after receiving notice of the owner or operator's intention. The notification from the Administrator to the owner or operator will specify the ground on which the disapproval is based. In the absence of a notice of disapproval within 45 days, approval is automatically granted.

(C) As soon as monitoring data indicate that the affected facility is not in compliance with any emission limitation or operating parameter specified in the applicable standard, the frequency of reporting shall revert to the frequency specified in the applicable standard, and the owner or operator shall submit an excess emissions and monitoring systems performance report (and summary report, if required) at the next appropriate reporting period following the noncomplying event. After demonstrating compliance with the applicable standard for another full year, the owner or operator may again request approval from the Administrator to reduce the frequency of reporting for that standard as provided for in paragraphs (iv)(A) and (iv)(B) of this subsection.

(v) Any owner or operator subject to the provisions of this part shall maintain a file of all measurements, including continuous monitoring system, monitoring device, and performance testing measurements; all continuous monitoring system performance evaluations; all continuous monitoring system or monitoring device calibration checks; adjustments and maintenance performed on these systems or devices; and all other information required by this part recorded in a permanent form suitable for inspection. The file shall be retained for at least two years following the date of such measurements, maintenance, reports, and record.

(vi) Individual subparts of 40 CFR part 60 may include specific provisions which clarify or made inapplicable the provisions set forth in this section.

(h) Performance Tests:

(i) The owner or operator of an affected facility shall conduct performance test(s) within the times specified in Chapter 6, Section 2(j) and furnish the Administrator a written report of the results of such performance test(s).

(ii) Performance tests shall be conducted and data reduced in accordance with the test methods and procedures contained in each applicable subpart unless the Administrator (1) specifies or approves, in specific cases, the use of a reference method with minor changes in methodology; (2) obtains approval from the EPA Administrator for use of an equivalent method; (3) obtains approval from the EPA Administrator for use of an alternative method the results of which he had determined to be adequate for indicating whether a specific source is in compliance; (4) waives the requirement for performance tests because the owner or operator of a source has demonstrated by other means to the Administrator's satisfaction that the affected facility is in compliance with the standard; or (5) approves shorter sampling times and smaller sample volumes when necessitated by process variables or other factors. Nothing in this paragraph shall be construed to abrogate the Administrator's authority to require other testing.

(iii) Performance tests shall be conducted under such conditions as the Administrator shall specify to the plant operator based on representative performance of the affected facility. The owner or operator shall make available to the Administrator such records as may be necessary to determine the conditions of the performance tests. Operations during periods of start-up, shutdown, and malfunction shall not constitute representative conditions for the purpose of a performance test nor shall emissions in excess of the level of the applicable emission limit during periods of start-up, shutdown, and malfunction be considered a violation of the applicable emission limit unless otherwise specified in the applicable standard.

(iv) The owner or operator of an affected facility shall provide, or cause to be provided, performance testing facilities as follows:

(A) Sampling ports adequate for test methods applicable to such facility. This includes:

(I) Constructing the air pollution control system such that volumetric flow rates and pollutant emission rates can be accurately determined by applicable test methods and procedures and;

(II) Providing a stack or duct free of cyclonic flow during performance tests, as demonstrated by applicable test methods and procedures;

(B) Safe sampling platform(s);

(C) Safe access to sampling platform(s);

(D) Utilities for sampling and testing equipment.

(v) Unless otherwise specified in the applicable subpart, each performance test shall consist of three separate runs using the applicable test method. Each run shall be conducted for the time and under the conditions specified in the applicable standard. For the purpose of determining compliance with an applicable standard, the arithmetic means of results of the three runs shall apply. In the event that a sample is accidentally lost or conditions occur in which one of the three runs must be discontinued because of forced shutdown, failure of an irreplaceable portion of the sample train, extreme meteorological conditions, or other circumstances, beyond the owner or operator's control, compliance may, upon the Administrator's approval, be determined using the arithmetic mean of the results of the two other runs.

(i) Compliance With Standards and Maintenance Requirements:

(i) Compliance with standards in this part, other than opacity standards, shall be determined by performance tests established by Chapter 5, Section 2(h), unless otherwise specified in the applicable standard.

(ii) Compliance with opacity standards in this part shall be determined by conducting observations in accordance with Reference Method 9 in 40 CFR part 60, Appendix A or any alternative method that is approved by the EPA Administrator, or as provided in paragraph (v)(D) of this section. For purposes of determining initial compliance, the minimum total time of observations shall be 3 hours (30 6-minute averages) for the performance test or other set of observations (meaning those fugitive-type emission sources subject only to an opacity standard).

(iii) The opacity standards set forth in this part shall apply at all times except during periods of start-up, shutdown, malfunction, and as otherwise provided in the applicable standard.

(iv) At all times, including periods of start-up, shutdown, and malfunction, owners and operators shall, to the extent practicable, maintain and operate any affected facility including associated air pollution control equipment in a manner consistent with good air pollution control practice for minimizing emissions. Determination of whether acceptable operating and maintenance procedures are being used will be based on information available to the Administrator which may include, but is not limited to, monitoring results, opacity observations, review of operating and maintenance procedures, and inspection of the source.

(v) (A) For the purpose of demonstrating initial compliance, opacity observations shall be conducted concurrently with the initial performance test required in Chapter 5, Section 2(h) unless one of the following conditions apply. If no performance test under Chapter 5, Section 2(h) is required, then opacity observations shall be conducted within 60 days after achieving the maximum production rate at which the affected facility will be operated but no later than 180 days after initial start-up of the facility. If visibility or other conditions prevent the opacity observations from being conducted concurrently with the initial performance test required under Chapter 5, Section 2(h), the source owner or operator shall reschedule the opacity observations as soon after the initial performance test as possible, but not later than 30 days thereafter, and shall advise the Administrator of the rescheduled date. In these cases, the 30-day prior notification to the Administrator required in Chapter 5, Section 2(g)(i)(D) shall be waived. The rescheduled opacity observations shall be conducted (to the extent possible) under the same operating conditions that existed during the initial performance test conducted under Chapter 5, Section 2(h). The visible emissions observer shall determine whether visibility or other conditions prevent the opacity observations from being made concurrently with the initial performance test in accordance with procedures contained in Reference Method 9 of 40 CFR part 60, Appendix A. Opacity reading of portions of plumes which contain condensed, uncombined water vapor shall not be used for purposes of determining compliance with opacity standards. The owner or operator of an affected facility shall make available, upon request by the Administrator, any records as may be necessary to determine the conditions under which the visual observations were made and shall provide evidence indicating proof of current visible observer emission certification. Except as provided in paragraph (v)(D) of this section, the results of continuous monitoring by transmissometer which indicate that the opacity at the time visual observations were made was not in excess of the standard are probative but not conclusive evidence of the actual opacity of an emission, provided that the source shall meet the burden of proving that the instrument used meets (at the time of the alleged violation) Performance Specification 1 in 40 CFR part 60, Appendix B, has been properly maintained and (at the time of the alleged violation) that the resulting data have not been altered in any way.

(I) The inability of an owner or operator to secure a visible emissions observer shall not be considered a reason for not conducting the opacity observations concurrent with the initial performance test.

(B) The owner or operator of an affected facility to which an opacity standard in this part applies shall conduct opacity observations in accordance with Chapter 5, Section 2(i)(ii), shall record the opacity of emissions, and shall report to the Administrator the opacity results along with the results of the initial performance test required under Chapter 5, Section 2(h).

(C) An owner or operator of an affected facility using a continuous opacity monitor (transmissometer) shall record the monitoring data produce during the initial performance test required by Chapter 5, Section 2(h) and furnish the Administrator a written report of the monitoring results along with Method 9 and Chapter 5, Section 2(h) performance test results.

(D) An owner or operator of an affected facility subject to an opacity standard may submit, for compliance purposes, continuous opacity monitoring system (COMS) data results produced during any performance test required under Chapter 5, Section 2(h) in lieu of Method 9 observation data. If an owner or operator elects to submit COMS data for compliance with the opacity standard, he shall notify the Administrator of that decision in writing, at least 30 days before any performance test required under Chapter 5, Section 2(h) is conducted. Once the owner or operator of an affected facility has notified the Administrator to that Effect, the COMS data results will be used to determine opacity compliance during subsequent tests required under Chapter 5, Section 2(h) until the owner or operator notifies the Administrator in writing to the contrary. For the purpose of determining compliance with the opacity standard during a performance test required under Chapter 5, Section 2(h) using COMS data the minimum total time of COMS data collection shall be averages of all 6-minute continuous periods within the duration of the mass emission performance test. Results of the COMS opacity determinations shall be submitted along with the results of the performance test required under Chapter 5, Section 2(h). The owner or operator of an affected facility using a COMS for compliance purposes is responsible for demonstrating that the COMS meets the requirements specified in Chapter 5, Section 2(j)(iii) of this part, that the COMS has been properly maintained and operated, and that the resulting data have not been altered in any way. If COMS data results are submitted for compliance with the opacity standard for a period of time during which Method 9 data indicates noncompliance, the Method 9 data will be used to determine opacity compliance.

(E) Upon receipt from an owner or operator of the written reports of the results of the performance tests required by Chapter 5, Section 2(h), the opacity observation results and observer certification required by Chapter 5, Section 2(i)(v)(A) and the COMS results, if applicable, the Administrator will make a finding concerning compliance with opacity and other applicable standards. If COMS data results are used to comply with an opacity standard, only those results are required to be submitted along with the performance test results required by Chapter 5, Section 2(h). If the Administrator finds that an affected facility is in compliance with all applicable standards for which performance tests are conducted in accordance with Chapter 5, Section 2(h) of this part but during the time such performance tests are being conducted fails to meet any

applicable opacity standard, he shall notify the owner or operator and advise him that he may petition the Administrator within 10 days of receipt of notification to make appropriate adjustment to the opacity standard for the affected facility. The notifications received requesting adjustments to the opacity standard of the affected facility will be forwarded to EPA for resolution.

(vi) Special provisions set forth under an applicable subpart in 40 CFR part 60 shall supersede any conflicting provisions in this section.

(vii) For the purpose of submitting compliance certifications or establishing whether or not a person has violated or is in violation of any standard in this section, nothing in this section shall preclude the use, including the exclusive use, of any credible evidence or information, relevant to whether a source would have been in compliance with the applicable requirements if the appropriate performance or compliance test or procedure had been performed.

(j) Monitoring Requirements:

(i) For the purposes of this section, all continuous monitoring systems required under applicable subparts shall be subject to the provisions of this section upon promulgation of performance specifications for continuous monitoring systems under 40 CFR part 60, Appendix B and, if the continuous monitoring system is used to demonstrate compliance with emission limits on a continuous basis, 40 CFR part 60, Appendix F, unless otherwise specified in an applicable subpart or by the Administrator. Appendix F is applicable December 4, 1987.

(ii) All continuous monitoring systems and monitoring devices shall be installed and operational prior to conducting performance tests under Chapter 5, Section 2(h). Verification of operational status shall, as a minimum, include completion of manufacturer's written requirements or recommendations for installation, operation, and calibration of the device.

(iii) If the owner or operator of an affected facility elects to submit continuous opacity monitoring system (COMS) data for compliance with the opacity standard as provided under Chapter 5, Section 2(i)(v)(D), he shall conduct a performance evaluation of the COMS as specified in Performance Specification 1, 40 CFR part 60, Appendix B, before the performance test required under Chapter 5, Section 2(h) is conducted. Otherwise, the owner or operator of an affected facility shall conduct a performance evaluation of the COMS or continuous emission monitoring system (CEMS) during any performance test required under Chapter 5, Section 2(h) or within 30 days thereafter in accordance with the applicable performance specification in 40 CFR part 60, Appendix B. The owner or operator of an affected facility shall conduct COMS or CEMS performance evaluations at such other times as may be required by the Administrator.

(A) The owner or operator of an affected facility using a COMS to determine opacity compliance during any performance test required under Chapter 5, Section 2(h) and as described in Chapter 5, Section 2(i)(v)(D) shall furnish the Administrator two or, upon request, more copies of a written report of the results of the COMS performance evaluation described in paragraph (iii) of this section at least 10 days before the performance test required under Chapter 5, Section 2(h) is conducted.

(B) Except as provided in paragraph (iii)(A) of this section, the owner or operator of an affected facility shall furnish the Administrator within 60 days of completion two or, upon request, more copies of a written report of the results of the performance evaluation.

(C) These continuous monitoring system performance evaluations, except as provided in paragraph (x) of this section shall be conducted in accordance with the requirements and procedures contained in the applicable performance specification of 40 CFR part 60, Appendix B as follows:

(I) Continuous monitoring systems for measuring opacity of emissions installed on or after March 30, 1983 shall comply with all the provisions and requirements in Performance Specification 1: continuous monitoring systems for measuring opacity of emissions installed before March 30, 1983 are required to comply with the provisions and requirements of Performance Specification 1 except for the following:

(1.) Section 4 - Installation specifications.

(2.) Paragraphs 5.1.4 - Optical alignment sight, 5.1.6 - Access to external optics, 5.1.7 - Automatic zero compensation indicator, and 5.1.8 - Slotted tube of Section 5 - Design and Performance Specification 1.

(3.) Paragraph 6.4 - Optical alignment sight of Section 6. Design specifications verification procedure.

If an existing opacity monitoring system is replaced on or after March 30, 1983, the new opacity monitoring system shall comply with the requirements of Performance Specification 1, except the new monitoring system may be located at the same measurement location as for the replaced monitoring system. If a new measurement location is to be determined at the time of replacement, the new location must meet the requirements of Performance Specification 1.

(II) Continuous monitoring systems for measuring nitrogen oxides emissions shall comply with Performance Specification 2.

(III) Continuous monitoring systems for measuring sulfur dioxide emissions shall comply with Performance Specification 2.

(IV) Continuous monitoring systems for measuring the oxygen content or carbon dioxide content of effluent gases shall comply with Performance Specification 3.

(iv) (A) Owners and operators of all continuous emission monitoring systems installed in accordance with the provisions of this part shall check the zero (or low-level value between 0 and 20 percent of span value) and span (50 to 100 percent of span value) calibration drifts at least once daily in accordance with a written procedure. The zero and span shall, as a minimum, be adjusted whenever the 24-hour zero drift or 24-hour span drift exceeds two times the limits of the applicable performance specifications in 40 CFR part 60, Appendix B. The system must allow the amount of excess zero and span drift measured at the 24-hour interval checks to be recorded and quantified, whenever specified. For continuous monitoring systems measuring opacity of emissions, the optical surfaces exposed to the effluent gases shall be cleaned prior to performing the zero and span drift adjustments except that for systems using automatic zero adjustments, the optical surfaces shall be cleaned when the cumulative zero compensation exceeds 4 percent opacity.

(B) Unless otherwise approved by the Administrator, the following procedures shall be followed for continuous monitoring systems measuring opacity of emissions. Minimum procedures shall include a method for producing a simulated zero opacity condition and an upscale (span value) opacity condition using a certified neutral density filter or other related technique to produce a known obscuration of the light beam. Such procedures shall provide a system check of the analyzer internal optical surfaces and all electronic circuitry including the lamp and photodetector assembly.

(v) Except for system breakdown, repairs, calibration checks, and zero and span adjustments required under paragraph (iv) of this section, all continuous monitoring systems shall be in continuous operation and shall meet minimum frequency of operation requirements as follows:

(A) All continuous monitoring systems referenced by paragraphs (iii)(A) and (B) of this section for measuring opacity of emissions shall complete a minimum of one cycle of sampling and analyzing for each successive ten-second period and one cycle of data recording for each successive six-minute period.

(B) All continuous monitoring systems referenced by paragraphs (iii)(A) and (B) of this section for measuring emissions, except opacity shall complete a minimum of one cycle of operation (sampling, analyzing, and data recording) for each successive 15-minute period.

(vi) All continuous monitoring systems or monitoring devices shall be installed such that representative measurements of emissions or process parameters from the affected facility are obtained. Additional procedures for location of continuous

monitoring systems contained in the applicable Performance Specifications of 40 CFR part 60, Appendix B of this section shall be used.

(vii) When the effluents from a single affected facility or two or more affected facilities subject to the same emission standards are combined before being released to the atmosphere, the owner or operator may install applicable continuous monitoring systems on each effluent or on the combined effluent. When the affected facilities are not subject to the same emissions standards, separate continuous monitoring systems shall be installed on each effluent. When the effluent from one affected facility is released to the atmosphere through more than one point, the owner or operator shall install applicable continuous monitoring systems on each separate effluent unless the installation of fewer systems is approved by the Administrator. When more than one continuous monitoring system is used to measure the emissions from one affected facility (e.g., multiple breechings, multiple outlets), the owner or operator shall report the results as required from each continuous monitoring system.

(viii) Owners or operators of all continuous monitoring systems for measurement of opacity shall reduce all data to six-minute averages and for systems other than opacity to one-hour averages for time period defined under Chapter 5, Section 2(c)(i). Six-minute opacity averages shall be calculated from 36 or more data points equally spaced over each six-minute period. For systems other than opacity, one-hour averages shall be computed from four or more data points equally spaced over each one-hour period. Data recorded during periods of system breakdowns, repairs, calibration checks, and zero and span adjustments shall not be included in the data averages computed under this paragraph. An arithmetic or integrated average of all data may be used. The data output of all continuous monitoring systems may be recorded in reduced or non-reduced form (e.g., ppm pollutant and percent O₂ or lb/million Btu of pollutant). All excess emissions shall be converted into units of the standard using the applicable conversion procedures specified in subparts. After conversion into units of the standard, the data may be rounded to the same number of significant digits used in subparts to specify the applicable standard (e.g., rounded to the nearest one percent opacity).

(ix) Upon written application by an owner or operator, the Administrator may approve alternatives to any monitoring procedures or requirements of this part including, but not limited to the following:

(A) Alternative monitoring requirements when installation of a continuous monitoring system or monitoring device specified by this part would not provide accurate measurements due to liquid water or other interferences caused by substances with the effluent gases.

(B) Alternative monitoring requirements when the affected facility is infrequently operated.

(C) Alternative monitoring requirement to accommodate continuous monitoring systems that require additional measurements to correct for stack moisture conditions.

(D) Alternative locations for installing continuous monitoring systems or monitoring devices when the owner or operator can demonstrate that installation at alternate locations will enable accurate and representative measurements.

(E) Alternative methods of converting pollutant concentration measurements to units of the standards.

(F) Alternative procedures for performing daily checks of zero and span drift that do not involve use of span gases or test cells.

(G) Alternatives to the A.S.T.M. test methods or sampling procedures specified by any subpart.

(H) Alternative continuous monitoring systems that do not meet the design or performance requirements in Performance Specification 1 of 40 CFR part 60, Appendix B, but adequately demonstrate a definite and consistent relationship between its measurements and the measurements of opacity by a system complying with the requirements in Performance Specification 1. The Administrator may require that such demonstration be performed for each affected facility.

(I) Alternative monitoring requirements when the effluent from a single affected facility or the combined effluent from two or more affected facilities are released to the atmosphere through more than one point.

(x) An alternative to the relative accuracy test specified in Performance Specification 2 of 40 CFR part 60, Appendix B may be requested as follows:

(A) An alternative to the reference method tests for determining relative accuracy is available for sources with emission rates demonstrated to be less than 50 percent of the applicable standard. A source owner or operator may petition the Administrator to waive the relative accuracy test in Section 7 of Performance Specification 2 and substitute the procedures in Section 10 if the results of the performance test conducted according to the requirements in Chapter 5, Section 2(h) of this subpart or other tests performed following the criteria in Chapter 5, Section 2(h) demonstrate that the emission rate of the pollutant of interest in the units of the applicable standard is less than 50 percent of the applicable standard. For sources subject to standards expressed as control efficiency levels, a source owner or operator may petition the Administrator to waive the relative accuracy test and substitute the procedures in Section 10 of Performance Specification 2 if the control device exhaust emission rate is less than 50 percent of the level needed to meet the control efficiency requirement. The alternative procedures do not apply if the continuous emission monitoring system is used

to determine compliance continuously with the applicable standard. The petition to waive the relative accuracy test shall include a detailed description of the procedures to be applied. Included shall be location and procedure for conducting the alternative, the concentration or response levels of the alternative RA materials, and the other equipment checks included in the alternative procedure. The Administrator will review the petition for completeness and applicability. The determination to grant a waiver will depend on the intended use of the CEMS data (e.g., data collection purposes other than NSPS) and may require specifications more stringent than in Performance Specification 2 (e.g., the applicable emission limit is more stringent than NSPS).

(B) The waiver of CEMS relative accuracy test will be reviewed and may be rescinded at such time following successful completion of the alternative RA procedure that the CEMS data indicate the source emissions approaching the level of the applicable standard. The criterion for reviewing the waiver is the collection of CEMS data showing that emissions have exceeded 70 percent of the applicable standard for seven consecutive averaging periods as specified by the applicable regulation(s). For sources subject to standards expressed as control efficiency levels, the criterion for reviewing the waiver is the collection of CEMS data showing that exhaust emissions have exceeded 70 percent of the level needed to meet the control efficiency requirement for seven consecutive averaging periods as specified by the applicable regulation(s). It is the responsibility of the source operator to maintain records and determine the level of emissions relative to the criterion on the waiver of relative accuracy testing. If this criterion is exceeded, the owner or operator must notify the Administrator within 10 days of such occurrence and include a description of the nature and cause of increasing emissions. The Administrator will review the notification and may rescind the waiver and require the owner or operator to conduct a relative accuracy test of the CEMS as specified in Section 7 of Performance Specification 2.

(k) Modification:

(i) Except as provided under paragraphs (iv) and (v) of this section, any physical or operational change to an existing facility which results in an increase in the emission rate to the atmosphere of any pollutant to which a standard applies shall be considered a modification. Upon modification, an existing facility shall become an affected facility for each pollutant to which a standard applies and for which there is an increase in the emission rate to the atmosphere.

(ii) Emission rate shall be expressed as kg/hr of any pollutant discharged into the atmosphere for which a standard is applicable. The Administrator shall use the following to determine emission rate:

(A) Emission factors as specified in the latest issue of "Compilation of Air Pollutant Emission Factors", EPA Publication No. AP-42, or other emission factors determined by the Administrator to be superior to AP-42 emission factors, in cases where utilization of emission factors demonstrate that the emission level

resulting from the physical or operational change will either clearly increase or clearly not increase.

(B) Material balances, continuous monitor data, or manual emission tests in cases where utilization of emission factors as referenced in paragraph (ii)(A) of this section does not demonstrate to the Administrator's satisfaction whether the emission level resulting from the physical or operational change will either clearly increase or clearly not increase, or where an owner or operator demonstrates to the Administrator's satisfaction that there are reasonable grounds to dispute the result obtained by the Administrator utilizing emission factors as referenced in paragraph (ii)(A) of this section. When the emission rate is based on results from manual emission tests or continuous monitoring systems, the procedures specified in 40 CFR part 60, Appendix C shall be used to determine whether an increase in emission rate has occurred. Tests shall be conducted under such conditions as the Administrator shall specify to the owner or operator based on representative performance of the facility. At least three valid test runs must be conducted before and at least three after the physical or operational change. All operating parameters which may affect emissions must be held constant to the maximum feasible degree for all test runs.

(iii) The addition of an affected facility to a stationary source as an expansion to that source or as a replacement for an existing facility shall not by itself bring within the applicability of this part any other facility within that source.

(iv) The following shall not, by themselves, be considered modifications under this part:

(A) Maintenance, repair, and replacement which the Administrator determines to be routine for a source category, subject to the provisions of paragraph (iii) of this section and Chapter 5, Section 2(I).

(B) An increase in production rate of an existing facility, if that increase can be accomplished without a capital expenditure on that facility.

(C) An increase in the hours of operation.

(D) Use of an alternative fuel or raw material if, prior to the date any standard under this part becomes applicable to that source type, as provided by Chapter 5, Section 2(d), the existing facility was designed to accommodate that alternative use. A facility shall be considered to be designed to accommodate an alternative fuel or raw material if that use could be accomplished under the facility's construction specifications, as amended, prior to the change. Conversion to coal required for energy considerations as specified in section 111(a)(8) of the Act, shall not be considered a modification.

(E) The addition or use of any system or device whose primary function is the reduction of air pollutants, except when an emission control system is removed or is replaced by a system which the Administrator determines to be less environmentally beneficial.

(F) The relocation or change in ownership of an existing facility.

(v) Special provisions set forth under an applicable subpart shall supersede any conflicting provisions of Chapter 5, Section 2(k).

(vi) Within 180 days of the completion of any physical or operational change subject to the control measures specified in paragraphs 2(k)(i) of this section, compliance with all applicable standards must be achieved.

(vii) No physical change, or change in the method of operation, at an existing electric utility steam generating unit shall be treated as a modification for the purposes of this subsection provided that such change does not increase the maximum hourly emissions of any pollutant regulated under this subsection above the maximum hourly emissions achievable at that unit during the 5 years prior to the change.

(viii) Repowering projects that are awarded funding from the Department of Energy as permanent clean coal technology demonstration projects (or similar projects funded by EPA) are exempt from the requirements of this section provided that such change does not increase the maximum hourly emissions of any pollutant regulated under this section above the maximum hourly emissions achievable at that unit during the five years prior to the change.

(ix) (A) Repowering projects that qualify for an extension under section 409(b) of the Clean Air Act are exempt from the requirements of this section, provided that such change does not increase the actual hourly emissions of any pollutant regulated under this section above the actual hourly emissions achievable at that unit during the 5 years prior to the change.

(B) This exemption shall not apply to any new unit that:

(I) Is designated as a replacement for an existing unit;

(II) Qualifies under section 409(b) of the Clean Air Act for an extension of an emission limitation compliance date under section 405 of the Clean Air Act; and

(III) Is located at a different site than the existing unit.

(x) The installation, operation, cessation, or removal of a temporary clean coal technology demonstration project is exempt from the requirements of this section. A

temporary clean coal control technology demonstration project, for the purposes of this section is a clean coal technology demonstration project that is operated for a period of 5 years or less, and which complies with the State implementation plan for the state in which the project is located and other requirements necessary to attain and maintain the National Ambient Air Quality Standards during the project and after it is terminated.

(xi) The reactivation of a very clean coal-fired electric utility steam generating unit is exempt from the requirements of this section.

(l) Reconstruction:

(i) An existing facility, upon reconstruction, becomes an affected facility, irrespective of any change in emission rate.

(ii) **“Reconstruction”** means the replacement of components of an existing facility to such an extent that:

(A) The fixed capital cost of the new components exceeds 50 percent of the fixed capital cost that would be required to construct a comparable entirely new facility, and

(B) It is technologically and economically feasible to meet the applicable standards set forth in this part.

(iii) **“Fixed capital cost”** means the capital needed to provide all the depreciable components.

(iv) If an owner or operator of an existing facility proposes to replace components, and the fixed capital cost of the new components exceeds 50 percent of the fixed capital cost that would be required to construct a comparable entirely new facility, he shall notify the Administrator of the proposed replacements. The notice must be postmarked 60 days (or as soon as practicable) before construction of the replacements is commenced and must include the following information:

(A) Name and address of the owner or operator.

(B) The location of the existing facility.

(C) A brief description of the existing facility and the components which are to be replaced.

(D) A description of the existing air pollution control equipment and the proposed air pollution control equipment.

(E) An estimate of the fixed capital cost of the replacements and of constructing a comparable entirely new facility.

(F) The estimated life of the existing facility after the replacements.

(G) A discussion of any economic or technical limitations the facility may have in complying with the applicable standards of performance after the proposed replacements.

(v) The Administrator will determine, within 30 days of the receipt of the notice required by paragraph (iv) of this section and any additional information he may reasonably require, whether the proposed replacement constitutes reconstruction.

(vi) The Administrator's determination under paragraph (v) shall be based on:

(A) The fixed capital cost of the replacements in comparison to the fixed capital cost that would be required to construct a comparable entirely new facility;

(B) The estimated life of the facility after the replacements compared to the life of a comparable entirely new facility;

(C) The extent to which the components being replaced cause or contribute to the emissions from the facility and

(D) Any economic or technical limitations on compliance with applicable standards of performance which are inherent in the proposed replacements.

(vii) Individual subparts may include specific provisions which refine and delimit the concept of reconstruction set forth in this section.

(m) General Control Device Requirements:

(i) This section contains requirements for control devices used to comply with applicable subparts of Chapter 5, Section 2. The requirements are placed here for administrative convenience and only apply to facilities covered by subparts referring to this section.

(ii) Flares:

(A) General Design:

(I) Flares shall be designed for and operated with no visible emissions as determined by the methods specified in paragraph (D), except for periods not to exceed a total of 5 minutes during any 2 consecutive hours.

(II) Flares shall be operated with flame present at all times, as determined by the methods specified in paragraph (D).

(III) Flares shall be used only with the net heating value of the gas being combusted being 300 Btu/Scf (11.2 MJ/scm) or greater if the flare is steam-assisted or air-assisted or with the net heating value of the gas being combusted being 200 Btu/scf (7.45 MJ/scm) or greater if the flare is nonassisted. The net heating value of the gas being combusted shall be determined by the methods specified in paragraph (D).

(IV) Steam-assisted and nonassisted flare shall be designed for and operated with an exit velocity as determined by the methods specified in paragraph (D)(IV), less than 60 ft/sec (18.3 m/sec) except as follows:

(1.) Steam-assisted and nonassisted flares designed for and operated with an exit velocity, as determined by the methods specified in paragraph (D)(IV) equal to or greater than 60 ft/sec (18.3 m/sec) but less than 400 ft/sec (122 m/sec) are allowed if the net heating value of the gas being combusted is greater than 1000 Btu/scf (37.3 MJ/scm).

(2.) Steam-assisted and nonassisted flares designed for and operated with an exit velocity as determined by the methods specified in paragraph (D)(IV), less than the velocity V_{max} , as determined by the method specified in paragraph (D)(V), and less than 400 ft/sec (122 m/sec) are allowed.

(V) Air-assisted flares shall be designed and operated with an exit velocity less than the velocity, V_{max} , as determined by the method specified in paragraph (D)(VI).

(VI) Flares used to comply with this section shall be steam-assisted, air-assisted or nonassisted.

(B) Owners or operators of flares used to comply with the provisions of this section shall monitor these control devices to ensure that they are operated and maintained in conformance with their designs. Applicable subparts will provide provisions stating how owners or operators of flares shall monitor these control devices.

(C) Flares used to comply with the provisions of an applicable subpart shall be operated at all times when emissions may be vented to them.

(D) Determinations:

(I) Reference Method 22 shall be used to determine the compliance of flares with the visible emission provisions of this section. The observation period is 2 hours and shall be used according to Method 22.

(II) The presence of a flare pilot flame shall be monitored using a thermocouple or any other equivalent device to detect the presence of a flame.

(III) The net heating value of the gas being combusted in a flare shall be calculated using the following equation:

$$H_T = K \sum_{i=1}^n C_i H_i$$

where:

H_T = Net heating value of the sample, MJ/scm; where the net enthalpy per mole of offgas is based on combustion at 25°C and 760 mm Hg, but the standard temperature for determining the value corresponding to one mole is 20°C.

K = Constant,

$$1.740 \times 10^{-7} \left(\frac{1}{ppm} \right) \left(\frac{gmole}{scm} \right) \left(\frac{MJ}{kcal} \right)$$

Where the standard temperature of $\left(\frac{gmole}{scm} \right)$ is 20°C

C_i = Concentration of sample component i in ppm on a wet basis, as measured for organics by reference method 18 and measured for hydrogen and carbon monoxide by ASTM D1946-90 (2006) Standard Practice for Analysis of Reformed Gas by Gas Chromatography.

H_i = Net heat of combustion of sample component i, kcal/g mole at 25°C and 760 mm Hg. The heats of combustion may be determined using ASTM D4809-00 (2005) Standard Test Method for Heat of Combustion of Liquid Hydrocarbon Fuels by Bomb Calorimeter (Precision Method) if published values are not available or cannot be calculated.

(IV) The actual exit velocity of a flare shall be determined by dividing the volumetric flowrate (in units of standard temperature and pressure), as determined by reference methods 2, 2A, 2C, or 2D as appropriate; by the unobstructed (free) cross sectional area of the flare tip.

(V) The maximum permitted velocity V_{\max} , for flares complying with paragraph (A)(IV)(2.) shall be determined by the following equation:

$$\text{Log}_{10}(V_{\max}) = \frac{H_T + 28.80}{31.7}$$

V_{\max} = Maximum permitted velocity, m/sec

28.8 = Constant

31.7 = Constant

H_T = The net heating value as determined in paragraph (D)(III)

(VI) The maximum permitted velocity, V_{\max} , for air-assisted flares shall be determined by the following equation:

$$V_{\max} = 8.706 + 0.7084(H_T)$$

V_{\max} = Maximum permitted velocity m/sec

8.706 = Constant

0.7084 = Constant

H_T = The net heating value as determined in paragraph (D)(III)

(n) General Notification and Reporting Requirements:

(i) For the purposes of this section, time periods specified in days shall be measured in calendar days, even if the word “calendar” is absent, unless otherwise specified in an applicable requirement.

(ii) For the purposes of this section, if an explicit postmark deadline is not specified in an applicable requirement for the submittal of a notification, application, report, or other written communication to the Administrator, the owner or operator shall postmark the submittal on or before the number of days specified in the applicable requirement. For example, if a notification must be submitted 15 days before a particular event is scheduled to take place, the notification shall be postmarked on or before 15 days preceding the event; likewise, if a notification must be submitted 15 days after a particular event takes place, the notification shall be delivered or postmarked on or before 15 days following the end of the event. The use of reliable non-government mail carriers that provide indications of verifiable delivery of information required to be submitted to the Administrator, similar to the postmark provided by the U.S. Postal Service, or alternative means of delivery agreed to by the permitting authority, is acceptable.

(iii) Notwithstanding time period or postmark deadlines specified in this section for the submittal of information to the Administrator by an owner or operator, or the review of such information by the Administrator, such time periods or deadlines may be changed by mutual agreement between the owner or operator and the Administrator.

Procedures governing the implementation of this provision are specified in paragraph (vi) of this subsection.

(iv) The owner or operator may change the dates by which periodic reports under this section shall be submitted (without changing the frequency of reporting) to be consistent with the schedule specified in Chapter 5, Section 2, by mutual agreement between the owner or operator and the Administrator. The allowance in the previous sentence applies in each state beginning 1 year after the affected facility is required to be in compliance with the applicable subpart in 40 CFR part 63. Procedures governing the implementation of this provision are specified in paragraph (vi) of this subsection.

(v) If an owner or operator supervises one or more stationary sources affected by standards set under this section and standards set under 40 CFR part 61, Chapter 5, Section 3 or both, may be arranged by mutual agreement between the owner or operator and the Administrator a common schedule on which periodic reports required by each applicable standard shall be submitted throughout the year. The allowance in the previous sentence applies in each state beginning 1 year after the stationary source is required to be in compliance with the applicable subpart in this section, or 1 year after the stationary source is required to be in compliance with the applicable 40 CFR part 61 or Chapter 5, Section 3, whichever is latest. Procedures governing the implementation of this provision are specified in paragraph (vi) of this subsection.

(vi) (A) (I) Until an adjustment of a time period or postmark deadline has been approved by the Administrator under paragraphs (vi)(B) and (vi)(C) of this subsection, the owner or operator of an affected facility remains strictly subject to the requirements of this section.

(II) An owner or operator shall request the adjustment provided for in paragraphs (vi)(B) and (vi)(C) of this subsection each time changes to an applicable time period or postmark deadline specified in this section are desired.

(B) Notwithstanding time periods or postmark deadlines specified in this section for the submittal of information to the Administrator by an owner or operator, or the review of such information by the Administrator, such time periods or deadlines may be changed by mutual agreement between the owner or operator and the Administrator. An owner or operator who wishes to request a change in a time period or postmark deadline for a particular requirement shall request the adjustment in writing as soon as practicable before the subject activity is required to take place. The owner or operator shall include in the request whatever information is considered useful to convince the Administrator that an adjustment is warranted.

(C) If, in the Administrator's judgment, an owner or operator's request for an adjustment to a particular time period or postmark deadline is warranted, the Administrator will approve the adjustment. The Administrator will notify the owner

or operator in writing of approval or disapproval of the request for an adjustment within 15 calendar days of receiving sufficient information to evaluate the request.

(D) If the Administrator is unable to meet a specified deadline, the owner or operator will be notified of any significant delay and inform the owner or operator of the amended schedule.

Section 3. **National emission standards for hazardous air pollutants.**

(a) General: The U.S. Environmental Protection Agency regulations on national emission standards for hazardous air pollutants (NESHAP), established pursuant to section 112 of the Act as amended November 15, 1990, and amended by the word or phrase “substitutions” given in Chapter 5, Section 3(c) are incorporated into these regulations. The specific documents containing the complete text of the regulations are found in 40 CFR part 63. The standards designated in Chapter 5, Section 3(b) regulate specific categories of stationary sources that emit (or have the potential to emit) one or more of the hazardous air pollutants listed pursuant to section 112(b) of the Act, and presented in subsection (d)(ii)(A)(I) of Chapter 5, Section 3.

(b) Designated National Emission Standards for Hazardous Air Pollutants: The following standards for hazardous air pollutants, as revised and published in 40 CFR part 63, are incorporated by reference under Section 4(a) of this Chapter.

40 CFR part 63, Subpart D -	Regulations Governing Compliance Extensions for Early Reductions of Hazardous Air Pollutants
40 CFR part 63, Subpart F -	National Emission Standards for Organic Hazardous Air Pollutants From the Synthetic Organic Chemical Manufacturing Industry
40 CFR part 63, Subpart G -	National Emission Standards for Organic Hazardous Air Pollutants From the Synthetic Organic Chemical Manufacturing Industry for Process Vents, Storage Vessels, Transfer Operations, and Wastewater
40 CFR part 63, Subpart H -	National Emission Standards for Organic Hazardous Air Pollutants for Equipment Leaks

40 CFR part 63, Subpart I -	National Emission Standards for Organic Hazardous Air Pollutants for Certain Processes Subject to the Negotiated Regulation for Equipment Leaks
40 CFR part 63, Subpart J -	National Emission Standards for Hazardous Air Pollutants for Polyvinyl Chloride and Copolymers Production
40 CFR part 63, Subpart L -	National Emission Standards for Coke Oven Batteries
40 CFR part 63, Subpart M -	National Perchloroethylene Air Emission Standards for Dry Cleaning Facilities
40 CFR part 63, Subpart N -	National Emission Standards for Chromium Emissions From Hard and Decorative Chromium Electroplating and Chromium Anodizing Tanks
40 CFR part 63, Subpart O -	Ethylene Oxide Emissions Standards for Sterilization Facilities
40 CFR part 63, Subpart Q -	National Emission Standards for Hazardous Air Pollutants for Industrial Process Cooling Towers
40 CFR part 63, Subpart R -	National Emission Standards for Gasoline Distribution Facilities (Bulk Gasoline Terminals and Pipeline Breakout Stations)
40 CFR part 63, Subpart S -	National Emission Standards for Hazardous Air Pollutants from the Pulp and Paper Industry
40 CFR part 63, Subpart T -	National Emission Standards for Halogenated Solvent Cleaning

40 CFR part 63, Subpart U -	National Emission Standards for Hazardous Air Pollutant Emissions: Group I Polymers and Resins
40 CFR part 63, Subpart W -	National Emission Standards for Hazardous Air Pollutants for Epoxy Resins Production and Non-Nylon Polyamides Production
40 CFR part 63, Subpart X -	National Emission Standards for Hazardous Air Pollutants from Secondary Lead Smelting
40 CFR part 63, Subpart Y -	National Emission Standards for Marine Tank Vessel Loading Operations
40 CFR part 63, Subpart AA -	National Emission Standards for Hazardous Air Pollutants From Phosphoric Acid Manufacturing Plants
40 CFR part 63, Subpart BB -	National Emission Standards for Hazardous Air Pollutants From Phosphate Fertilizers Production Plants
40 CFR part 63, Subpart CC -	National Emission Standards for Hazardous Air Pollutants From Petroleum Refineries
40 CFR part 63, Subpart DD -	National Emission Standards for Hazardous Air Pollutants from Off-Site Waste and Recovery Operations
40 CFR part 63, Subpart EE -	National Emission Standards for Magnetic Tape Manufacturing Operations

40 CFR part 63, Subpart GG -	National Emission Standards for Aerospace Manufacturing and Rework Facilities
40 CFR part 63, Subpart HH -	National Emission Standards for Hazardous Air Pollutants From Oil and Natural Gas Production Facilities
40 CFR part 63, Subpart II -	National Emission Standards for Shipbuilding and Ship Repair (Surface Coating)
40 CFR part 63, Subpart JJ -	National Emission Standards for Wood Furniture Manufacturing Operations
40 CFR part 63, Subpart KK -	National Emission Standards for the Printing and Publishing Industry
40 CFR part 63, Subpart LL -	National Emission Standards for Hazardous Air Pollutants for Primary Aluminum Reduction Plants
40 CFR part 63, Subpart MM -	National Emission Standards for Hazardous Air Pollutants for Chemical Recovery Combustion Sources at Kraft, Soda, Sulfitic, and Stand-Alone Semichemical Pulp Mills
40 CFR part 63, Subpart OO -	National Emission Standards for Tanks - Level 1
40 CFR part 63, Subpart PP -	National Emission Standards for Containers
40 CFR part 63, Subpart QQ -	National Emission Standards for Surface Impoundments
40 CFR part 63, Subpart RR -	National Emission Standards for Individual Drain Systems

40 CFR part 63, Subpart SS -	National Emission Standards for Closed Vent Systems, Control Devices, Recovery Devices and Routing to a Fuel Gas System or a Process
40 CFR part 63, Subpart TT -	National Emission Standards for Equipment Leaks - Control Level 1
40 CFR part 63, Subpart UU -	National Emission Standards for Equipment Leaks - Control Level 2 Standards
40 CFR part 63, Subpart VV -	National Emission Standards for Oil-Water Separators and Organic-Water Separators
40 CFR part 63, Subpart WW -	National Emission Standards for Storage Vessels (Tanks) - Control Level 2
40 CFR part 63, Subpart XX -	National Emission Standards for Ethylene Manufacturing Process Units: Heat Exchange Systems and Waste Operations
40 CFR part 63, Subpart YY -	National Emission Standards for Hazardous Air Pollutants for Source Categories: Generic Maximum Achievable Control Technology Standards
40 CFR part 63, Subpart CCC -	National Emission Standards for Hazardous Air Pollutants for Steel Pickling - HCl Process Facilities and Hydrochloric Acid Regeneration Plants
40 CFR part 63, Subpart DDD -	National Emission Standards for Hazardous Air Pollutants for Mineral Wool Production
40 CFR part 63, Subpart EEE -	National Emission Standards for Hazardous Air Pollutants from Hazardous Waste Combustors

40 CFR part 63, Subpart GGG -	National Emission Standards for Pharmaceuticals Production
40 CFR part 63, Subpart HHH -	National Emission Standards for Hazardous Air Pollutants From Natural Gas Transmission and Storage Facilities
40 CFR part 63, Subpart III -	National Emission Standards for Hazardous Air Pollutants for Flexible Polyurethane Foam Production
40 CFR part 63, Subpart JJJ -	National Emission Standards for Hazardous Air Pollutant Emissions: Group IV Polymers and Resins
40 CFR part 63, Subpart LLL -	National Emission Standards for Hazardous Air Pollutants From the Portland Cement Manufacturing Industry
40 CFR part 63, Subpart MMM -	National Emission Standards for Hazardous Air Pollutants for Pesticide Active Ingredient Production
40 CFR part 63, Subpart NNN -	National Emission Standards for Hazardous Air Pollutants for Wool Fiberglass Manufacturing
40 CFR part 63, Subpart OOO -	National Emission Standards for Hazardous Air Pollutant Emissions: Manufacture of Amino/Phenolic Resins
40 CFR part 63, Subpart PPP -	National Emission Standards for Hazardous Air Pollutants for Polyether Polyols Production
40 CFR part 63, Subpart QQQ -	National Emission Standards for Hazardous Air Pollutants for Primary Copper Smelting

40 CFR part 63, Subpart RRR -	National Emission Standards for Hazardous Air Pollutants for Secondary Aluminum Production
40 CFR part 63, Subpart TTT -	National Emission Standards for Hazardous Air Pollutants for Primary Lead Smelting
40 CFR part 63, Subpart UUU -	National Emission Standards for Hazardous Air Pollutants for Petroleum Refineries: Catalytic Cracking Units, Catalytic Reforming Units, and Sulfur Recovery Units
40 CFR part 63, Subpart VVV -	National Emission Standards for Hazardous Air Pollutants: Publicly Owned Treatment Works
40 CFR part 63, Subpart XXX -	National Emission Standards for Hazardous Air Pollutants for Ferroalloys Production: Ferromanganese and Silicomanganese
40 CFR part 63, Subpart AAAA -	National Emission Standards for Hazardous Air Pollutants: Municipal Solid Waste Landfills
40 CFR part 63, Subpart CCCC -	National Emission Standards for Hazardous Air Pollutants: Manufacturing of Nutritional Yeast
40 CFR part 63, Subpart DDDD -	National Emission Standards for Hazardous Air Pollutants: Plywood and Composite Wood Products
40 CFR part 63, Subpart EEEE -	National Emission Standards for Hazardous Air Pollutants: Organic Liquids Distribution (Non-Gasoline)

40 CFR part 63, Subpart FFFF -	National Emission Standards for Hazardous Air Pollutants: Miscellaneous Organic Chemical Manufacturing
40 CFR part 63, Subpart GGGG -	National Emission Standards for Hazardous Air Pollutants: Solvent Extraction for Vegetable Oil Production
40 CFR part 63, Subpart HHHH -	National Emission Standards for Hazardous Air Pollutants for Wet-Formed Fiberglass Mat Production
40 CFR part 63, Subpart IIII -	National Emission Standards for Hazardous Air Pollutants: Surface Coating of Automobiles and Light-Duty Trucks
40 CFR part 63, Subpart JJJJ -	National Emission Standards for Hazardous Air Pollutants: Paper and Other Web Coating
40 CFR part 63, Subpart KKKK -	National Emission Standards for Hazardous Air Pollutants: Surface Coating of Metal Cans
40 CFR part 63, Subpart MMMM -	National Emission Standards for Hazardous Air Pollutants for Surface Coating of Miscellaneous Metal Parts and Products
40 CFR part 63, Subpart NNNN -	National Emission Standards for Hazardous Air Pollutants: Surface Coating of Large Appliances
40 CFR part 63, Subpart OOOO -	National Emission Standards for Hazardous Air Pollutants: Printing, Coating, and Dyeing of Fabrics and Other Textiles

40 CFR part 63, Subpart PPPP -	National Emission Standards for Hazardous Air Pollutants for Surface Coating of Plastic Parts and Products
40 CFR part 63, Subpart QQQQ -	National Emission Standards for Hazardous Air Pollutants: Surface Coating of Wood Building Products
40 CFR part 63, Subpart RRRR -	National Emission Standards for Hazardous Air Pollutants: Surface Coating of Metal Furniture
40 CFR part 63, Subpart SSSS -	National Emission Standards for Hazardous Air Pollutants: Surface Coating of Metal Coil
40 CFR part 63, Subpart TTTT -	National Emission Standards for Hazardous Air Pollutants for Leather Finishing Operations
40 CFR part 63, Subpart UUUU -	National Emission Standards for Hazardous Air Pollutants for Cellulose Products Manufacturing
40 CFR part 63, Subpart VVVV -	National Emission Standards for Hazardous Air Pollutants for Boat Manufacturing
40 CFR part 63, Subpart WWWW -	National Emissions Standards for Hazardous Air Pollutants: Reinforced Plastic Composites Production
40 CFR part 63, Subpart XXXX -	National Emission Standards for Hazardous Air Pollutants: Rubber Tire Manufacturing
40 CFR part 63, Subpart YYYY -	National Emission Standards for Hazardous Air Pollutants for Stationary Combustion Turbines

40 CFR part 63, Subpart ZZZZ -	National Emission Standards for Hazardous Air Pollutants for Stationary Reciprocating Internal Combustion Engines
40 CFR part 63, Subpart AAAAA -	National Emissions Standards for Hazardous Air Pollutants for Lime Manufacturing Plants
40 CFR part 63, Subpart BBBB -	National Emission Standards for Hazardous Air Pollutants for Semiconductor Manufacturing
40 CFR part 63, Subpart CCCCC -	National Emission Standards for Hazardous Air Pollutants for Coke Ovens: Pushing, Quenching, and Battery Stacks
40 CFR part 63, Subpart EEEEE -	National Emission Standards for Hazardous Air Pollutants for Iron and Steel Foundries
40 CFR part 63, Subpart FFFFF -	National Emission Standards for Hazardous Air Pollutants for Integrated Iron and Steel Manufacturing Facilities
40 CFR part 63, Subpart GGGGG -	National Emission Standards for Hazardous Air Pollutants: Site Remediation
40 CFR part 63, Subpart HHHHH -	National Emission Standards for Hazardous Air Pollutants: Miscellaneous Coating Manufacturing
40 CFR part 63, Subpart IIII -	National Emission Standards for Hazardous Air Pollutants: Mercury Emissions From Mercury Cell Chlor-Alkali Plants
40 CFR part 63, Subpart JJJJ -	National Emission Standards for Hazardous Air Pollutants for Brick and Structural Clay Products Manufacturing

40 CFR part 63, Subpart KKKKK -	National Emission Standards for Hazardous Air Pollutants for Clay Ceramics Manufacturing
40 CFR part 63, Subpart LLLLL -	National Emission Standards for Hazardous Air Pollutants: Asphalt Processing and Asphalt Roofing Manufacturing
40 CFR part 63, Subpart MMMMM -	National Emission Standards for Hazardous Air Pollutants: Flexible Polyurethane Foam Fabrication Operations
40 CFR part 63, Subpart NNNNN -	National Emission Standards for Hazardous Air Pollutants: Hydrochloric Acid Production
40 CFR part 63, Subpart PTTTT -	National Emission Standards for Hazardous Air Pollutants for Engine Test Cells/Standards
40 CFR part 63, Subpart QQQQQ -	National Emission Standards for Hazardous Air Pollutants for Friction Materials Manufacturing Facilities
40 CFR part 63, Subpart RRRRR -	National Emission Standards for Hazardous Air Pollutants: Taconite Iron Ore Processing
40 CFR part 63, Subpart SSSSS -	National Emission Standards for Hazardous Air Pollutants for Refractory Products Manufacturing
40 CFR part 63, Subpart TTTTT -	National Emissions Standards for Hazardous Air Pollutants for Primary Magnesium Refining
40 CFR part 63, Subpart BBBBBB -	National Emission Standards for Hazardous Air Pollutants for Source Category: Gasoline Distribution Bulk Terminals, Bulk Plants, and Pipeline Facilities

The following additional standard for hazardous air pollutants, not including later amendments, is adopted by reference from the *Federal Register*, as published by the National Archives and Records Administration. *Federal Register* publishing date, volume and pages for the standard is noted below:

September 13, 2004 Vol. 69, P. 55218	40 CFR part 63 - Subpart DDDDD	National Emission Standards for Hazardous Air Pollutants for Industrial, Commercial, and Institutional Boilers and Process Heaters
---	-----------------------------------	--

(i) Designated Appendices: The following appendices are incorporated by reference under Section 4(a) of this Chapter.

40 CFR part 63, Appendix A - Test Methods

40 CFR part 63, Appendix B - Sources Defined For Early Reduction Provisions

40 CFR part 63, Appendix C - Determination of the Fraction Biodegraded (F_{bio}) in a Biological Treatment Unit

40 CFR part 63, Appendix D - Alternative Validation Procedure for EPA Waste and Wastewater Methods

40 CFR part 63, Appendix E - Monitoring Procedure for Nonthoroughly Mixed Open Biological Treatment Systems at Kraft Pulp Mills Under Unsafe Sampling Conditions

(c) Word or Phrase Substitutions: In the standards designated in Chapter 5, Section 3(b) substitute:

- (i) Chapter 5, Section 3 for Subpart A.
- (ii) Chapter 5, Section 3(d) for 63.1.
- (iii) Chapter 5, Section 3(e) for 63.2.
- (iv) Chapter 5, Section 3(f) for 63.3.
- (v) Chapter 5, Section 3(g) for 63.4.
- (vi) Chapter 6, Section 5 for 63.5.
- (vii) Chapter 5, Section 3(h) for 63.6.
- (viii) Chapter 5, Section 3(i) for 63.7.
- (ix) Chapter 5, Section 3(j) for 63.8.
- (x) Chapter 5, Section 3(k) for 63.9.
- (xi) Chapter 5, Section 3(l) for 63.10.
- (xii) Chapter 5, Section 3(m) for 63.11.
- (xiii) Chapter 5, Section 3(n) for 63.15.

(d) Applicability.

(i) General.

(A) Terms used throughout Chapter 5, Section 3 are defined in subsection (e) or in the Clean Air Act (Act) as amended in 1990, except that the individual subparts listed in subsection (b) and contained in 40 CFR part 63, may include specific definitions in addition to or that supersede definitions in subsection (e).

(B) No emission standard or other requirement established under this section shall be interpreted, construed, or applied to diminish or replace the requirements of a more stringent emission limitation or other applicable requirement established by EPA or the Administrator including the requirements in Chapter 5, Section 2, New Source Performance Standards, or any standard defined in the WAQSR.

(C) The provisions of this section apply to owners or operators who are subject to subsequent subparts listed in Chapter 5, Section 3(b), except when otherwise specified in a particular subpart or in a relevant standard. The provisions of Chapter 5, Section 3 eliminate the repetition of requirements applicable to all owners or operators affected by this section. The provisions in Chapter 5, Section 3 do not apply to regulations developed pursuant to section 112(r) of the amended Act, unless otherwise specified in those regulations.

(D) Subpart D of 40 CFR part 63 contains regulations that address procedures for an owner or operator to obtain an extension of compliance with a relevant standard through an early reduction of emissions of hazardous air pollutants pursuant to section 112(i)(5) of the Act.

(E) For the purposes of this section, time periods specified in days shall be measured in calendar days, even if the word “calendar” is absent, unless otherwise specified in an applicable requirement.

(F) For the purposes of this section, if an explicit postmark deadline is not specified in an applicable requirement for the submittal of a notification, application, test plan, report, or other written communication to the Administrator, the owner or operator shall postmark the submittal on or before the number of days specified in the applicable requirement. For example, if a notification must be submitted 15 days before a particular event is scheduled to take place, the notification shall be postmarked on or before 15 days preceding the event; likewise, if a notification must be submitted 15 days after a particular event takes place, the notification shall be postmarked on or before 15 days following the end of the event. The use of reliable non-Government mail carriers that provide indications of verifiable delivery of information required to be submitted to the Administrator, similar to the postmark provided by the U.S. Postal Service, or alternative means of delivery agreed to by the Administrator, is acceptable.

(G) Notwithstanding time periods or postmark deadlines specified in this section for the submittal of information to the Administrator by an owner or operator, or the review of such information by the Administrator, such time periods or deadlines may be changed by mutual agreement between the owner or operator and the Administrator. Procedures governing the implementation of this provision are specified in Chapter 5, Section 3(k)(ix).

(H) Special provisions set forth under an applicable subpart or in a relevant standard established under this section shall supersede any conflicting provisions of Chapter 5, Section 3.

(I) Any standards, limitations, prohibitions, or other federally enforceable requirements established pursuant to procedural regulations in this section [including, but not limited to, equivalent emission limitations established pursuant to section 112(g) of the Act] shall have the force and effect of requirements established in this section and shall be subject to the provisions of Chapter 5, Section 3, except when explicitly specified otherwise.

(ii) Initial Applicability Determination For This Section.

(A) The provisions of this section apply to the owner or operator of any stationary source that:

(I) Emits or has the potential to emit any hazardous air pollutant listed in or pursuant to section 112(b) of the Act, and identified below:

CAS Number	Chemical Name
75070	Acetaldehyde
60355	Acetamide
75058	Acetonitrile
98862	Acetophenone
53963	2-Acetylaminofluorene
107028	Acrolein
79061	Acrylamide
79107	Acrylic acid
107131	Acrylonitrile
107051	Allyl chloride
92671	4-Aminobiphenyl
62533	Aniline
90040	o-Anisidine
1332214	Asbestos
71432	Benzene (including benzene from gasoline)

CAS Number	Chemical Name
92875	Benzidine
98077	Benzotrichloride
100447	Benzyl chloride
92524	Biphenyl
117817	Bis(2-ethylhexyl)phthalate (DEHP)
542881	Bis(chloromethyl)ether
75252	Bromoform
106990	1,3-Butadiene
156627	Calcium cyanamide
133062	Captan
63252	Carbaryl
75150	Carbon disulfide
56235	Carbon tetrachloride
463581	Carbonyl sulfide
120809	Catechol
133904	Chloramben
57749	Chlordane
7782505	Chlorine
79118	Chloroacetic acid
532274	2-Chloroacetophenone
108907	Chlorobenzene
510156	Chlorobenzilate
67663	Chloroform
107302	Chloromethyl methyl ether
126998	Chloroprene
1319773	Cresols/Cresylic acid (isomers and mixture)
95487	o-Cresol
108394	m-Cresol
106445	p-Cresol
98828	Cumene
94757	2,4-D, salts and esters
3547044	DDE
334883	Diazomethane
132649	Dibenzofurans
96128	1,2-Dibromo-3-chloropropane
84742	Dibutylphthalate
106467	1,4-Dichlorobenzene(p)
91941	3,3-Dichlorobenzidene
111444	Dichloroethyl ether (Bis(2-chloroethyl)ether)
542756	1,3-Dichloropropene
62737	Dichlorvos
111422	Diethanolamine
121697	N,N-Diethyl aniline (N,N-Dimethylaniline)
64675	Diethyl sulfate

CAS Number	Chemical Name
119904	3,3-Dimethoxybenzidine
60117	Dimethyl aminoazobenzene
119937	3,3-Dimethyl benzidine
79447	Dimethyl carbamoyl chloride
68122	Dimethyl formamide
57147	1,1-Dimethyl hydrazine
131113	Dimethyl phthalate
77781	Dimethyl sulfate
534521	4,6-Dinitro-o-cresol, and salts
51285	2,4-Dinitrophenol
121142	2,4-Dinitrotoluene
123911	1,4-Dioxane (1,4-Diethyleneoxide)
122667	1,2-Diphenylhydrazine
106898	Epichlorohydrin (1-Chloro-2,3-epoxypropane)
106887	1,2-Epoxybutane
140885	Ethyl acrylate
100414	Ethyl benzene
51796	Ethyl carbamate (Urethane)
75003	Ethyl chloride (Chloroethane)
106934	Ethylene dibromide (Dibromoethane)
107062	Ethylene dichloride (1,2-Dichloroethane)
107211	Ethylene glycol
151564	Ethylene imine (Aziridine)
75218	Ethylene oxide
96457	Ethylene thiourea
75343	Ethylidene dichloride (1,1-Dichloroethane)
50000	Formaldehyde
76448	Heptachlor
118741	Hexachlorobenzene
87683	Hexachlorobutadiene
77474	Hexachlorocyclopentadiene
67721	Hexachloroethane
822060	Hexamethylene-1, 6-diisocyanate
680319	Hexamethylphosphoramide
110543	Hexane
302012	Hydrazine
7647010	Hydrochloric acid
7664393	Hydrogen fluoride (Hydrofluoric acid)
123319	Hydroquinone
78591	Isophorone
58899	Lindane (all isomers)
108316	Maleic anhydride
67561	Methanol
72435	Methoxychlor

CAS Number	Chemical Name
74839	Methyl bromide (Bromomethane)
74873	Methyl chloride (Chloromethane)
71556	Methyl chloroform (1,1,1-Trichloroethane)
60344	Methyl hydrazine
74884	Methyl iodide (Iodomethane)
108101	Methyl isobutyl ketone (Hexone)
624839	Methyl isocyanate
80626	Methyl methacrylate
1634044	Methyl tert butyl ether
101144	4,4-Methylene bis(2-chloroaniline)
75092	Methylene chloride (Dichloromethane)
101688	Methylene diphenyl diisocyanate (MDI)
101779	4,4-Methylenedianiline
91203	Naphthalene
98953	Nitrobenzene
92933	4-Nitrobiphenyl
100027	4-Nitrophenol
79469	2-Nitropropane
684935	N-Nitroso-N-methylurea
62759	N-Nitrosodimethylamine
59892	N-Nitrosomorpholine
56382	Parathion
82688	Pentachloronitrobenzene (Quintobenzene)
87865	Pentachlorophenol
108952	Phenol
106503	p-Phenylenediamine
75445	Phosgene
7803512	Phosphine
7723140	Phosphorus
85449	Phthalic anhydride
1336363	Polychlorinated biphenyls (Aroclors)
1120714	1,3-Propane sultone
57578	beta-Propiolactone
123386	Propionaldehyde
114261	Propoxur (Baygon)
78875	Propylene dichloride (1,2-Dichloropropane)
75569	Propylene oxide
75558	1,2-Propylenimine (2-Methyl aziridine)
91225	Quinoline
106514	Quinone
100425	Styrene
96093	Styrene oxide
1746016	2,3,7,8-Tetrachlorodibenzo-p-dioxin
79345	1,1,2,2-Tetrachloroethane

CAS Number	Chemical Name
127184	Tetrachloroethylene (Perchloroethylene)
7550450	Titanium tetrachloride
108883	Toluene
95807	2,4-Toluene diamine
584849	2,4-Toluene diisocyanate
95534	o-Toluidine
8001352	Toxaphene (chlorinated camphene)
120821	1,2,4-Trichlorobenzene
79005	1,1,2-Trichloroethane
79016	Trichloroethylene
95954	2,4,5-Trichlorophenol
88062	2,4,6-Trichlorophenol
121448	Triethylamine
1582098	Trifluralin
540841	2,2,4-Trimethylpentane
108054	Vinyl acetate
593602	Vinyl bromide
75014	Vinyl chloride
75354	Vinylidene chloride (1,1-Dichloroethylene)
95476	o-Xylenes
108383	m-Xylenes
106423	p-Xylenes
0	Antimony Compounds
0	Arsenic Compounds (inorganic including arsine)
0	Beryllium Compounds
0	Cadmium Compounds
0	Chromium Compounds
0	Cobalt Compounds
0	Coke Oven Emissions
0	Cyanide Compounds *1
0	Glycol ethers *2
0	Lead Compounds
0	Manganese Compounds
0	Mercury Compounds
0	Fine mineral fibers *3
0	Nickel Compounds
0	Polycyclic Organic Matter *4
0	Radionuclides (including radon) *5
0	Selenium Compounds

NOTE: For all listings above which contain the word “compounds” and for glycol ethers, the following applies: Unless otherwise specified, these listings are defined as including any unique chemical substance that contains the named chemical (i.e., antimony, arsenic, etc.) as part of that chemical’s infrastructure.

- *1 X'CN where X=H' or any other group where a formal dissociation may occur. For example KCN or Ca(CN)₂
- *2 Includes mono- and di- ethers of ethylene glycol, diethylene glycol, and triethylene glycol R-(OCH₂CH₂)_n-OR' where
 - n = 1, 2, or 3
 - R = alkyl or aryl groups
 - R' = R, H, or groups which, when removed, yield glycol ethers with the structure: R-(OCH₂CH)_n-OH. Polymers are excluded from the glycol category.
- *3 Includes mineral fiber emissions from facilities manufacturing or processing glass, rock, or slag fibers (or other mineral derived fibers) of average diameter 1 micrometer or less.
- *4 Includes organic compounds with more than one benzene ring, and which have a boiling point greater than or equal to 100°C.
- *5 A type of atom which spontaneously undergoes radioactive decay.

and,

(II) Is subject to any standard, limitation, prohibition, or other federally enforceable requirement established pursuant to 40 CFR part 63.

(B) In addition to complying with the provisions of this section, the owner or operator of any such source may be required to obtain an operating permit issued in accordance with Chapter 6, Section 3 of the WAQSR.

(C) An owner or operator of a stationary source that emits (or has the potential to emit, without considering controls) one or more hazardous air pollutants who determines that the source is not subject to a relevant standard or other requirement established under this section, shall keep a record of the applicability determination as specified in Chapter 5, Section 3(l)(ii)(C).

(iii) Applicability of This Section After a Relevant Standard Has Been Set.

(A) If a relevant standard has been established under this section, the owner or operator of an affected source shall comply with the provisions of this section and the provisions of that standard, except as specified otherwise in this section or that standard.

(B) If a relevant standard has been established under this section, the owner or operator of an affected source may be required to obtain an operating permit in accordance with Chapter 6, Section 3. Emission standards established in this section for area sources will specify whether:

(I) The Administrator will have the option to exclude area sources affected by that standard from the requirement to obtain an operating permit (i.e., the standard will exempt the category of area sources altogether from the permitting requirement);

(II) The Administrator will have the option to defer permitting of area sources in that category until the EPA takes rulemaking action to determine applicability of the permitting requirements; or

(III) Area sources affected by that emission standard are immediately subject to the requirement to apply for and obtain an operating permit. If a standard fails to specify what the permitting requirements will be for area sources affected by that standard, then area sources that are subject to the standard will be subject to the requirements to obtain an operating permit without deferral. If the owner or operator is required to obtain an operating permit, the application for such a permit shall be in accordance with Chapter 6, Section 3 of the WAQSR.

(C) If the owner or operator of an existing source obtains an extension of compliance for such source in accordance with the provisions of 40 CFR part 63, Subpart D, the owner or operator shall comply with all requirements of this section except those requirements that are specifically overridden in the extension of compliance for that source.

(D) If an area source that otherwise would be subject to an emission standard or other requirement established under this section if it were a major source subsequently increases its emissions of hazardous air pollutants (or its potential to emit hazardous air pollutants) such that the source is a major source that is subject to the emission standard or other requirement, such source also shall be subject to the notification requirements of this section.

(iv) Applicability of Permit Program Before a Relevant Standard Has Been Set Under This Section. The owner or operator of a stationary source located or proposed for location in Wyoming may be required to obtain an operating permit in accordance with Chapter 6, Section 3 (or revise such a permit if one has already been issued to the source) before a relevant standard is established under this section.

(e) Definitions. The terms used in this section and the designated subparts are defined in the Act or in this subsection as follows:

“Act” means the Clean Air Act (42 U.S.C. 7401 et seq., as amended by Pub. L. 101-549, 104 Stat. 2399).

“Actual emissions” is defined in 40 CFR part 63, Subpart D for the purpose of granting a compliance extension for an early reduction of hazardous air pollutants.

“Administrator” means the Administrator of the Division of Air Quality, Wyoming Department of Environmental Quality.

“Affected source”, for the purposes of this section, means the stationary source, the group of stationary sources, or the portion of a stationary source that is regulated by a relevant standard or other requirement established pursuant to section 112 of the Act. Each relevant standard will define the “affected source” for the purposes of that standard. The term “affected source”, as used in this section, is separate and distinct from any other use of that term in EPA regulations. Sources regulated under Chapter 5, Section 2 of these regulations are not affected sources for the purposes of Chapter 5, Section 3.

“Alternative emission limitation” means conditions established pursuant to sections 112(i)(5) or 112(i)(6) of the Act by the EPA or the Administrator.

“Alternative emission standard” means an alternative means of emission limitation that, after notice and opportunity for public comment, has been demonstrated by an owner or operator to the Administrator’s satisfaction to achieve a reduction in emissions of any air pollutant at least equivalent to the reduction in emissions of such pollutant achieved under a relevant design, equipment, work practice, or operational emission standard, or combination thereof, established under this section pursuant to section 112(h) of the Act.

“Alternative test method” means any method of sampling and analyzing for an air pollutant that is not a test method in 40 CFR part 63 and that has been demonstrated to the Administrator’s satisfaction, using Method 301 in 40 CFR part 63, Appendix A, to produce results adequate for the Administrator’s determination that it may be used in place of a test method specified in this section.

“Area source” means any stationary source of hazardous air pollutants that is not a major source as defined in this section.

“Commenced” means, with respect to construction or reconstruction of a stationary source, that an owner or operator has undertaken a continuous program of construction or reconstruction or that an owner or operator has entered into a contractual obligation to undertake and complete, within a reasonable time, a continuous program of construction or reconstruction.

“Compliance date” means the date by which an affected source is required to be in compliance with a relevant standard, limitation, prohibition, or any federally enforceable requirement established by the EPA or the Administrator pursuant to section 112 of the Act.

“Compliance plan” means a plan that contains all of the following:

(i) A description of the compliance status of the affected source with respect to all applicable requirements established under this section;

(ii) A description as follows:

(A) For applicable requirements for which the source is in compliance, a statement that the source will continue to comply with such requirements;

(B) For applicable requirements that the source is required to comply with by a future date, a statement that the source will meet such requirements on a timely basis;

(C) For applicable requirements for which the source is not in compliance, a narrative description of how the source will achieve compliance with such requirements on a timely basis;

(iii) A compliance schedule, as defined in this subsection; and

(iv) A schedule for the submission of certified progress reports no less frequently than every 6 months for affected sources required to have a schedule of compliance to remedy a violation.

“Compliance schedule” means:

(i) In the case of an affected source that is in compliance with all applicable requirements established under this section, statement that the source will continue to comply with such requirements; or

(ii) In the case of an affected source that is required to comply with applicable requirements by a future date, a statement that the source will meet such requirements on a timely basis and, if required by an applicable requirement, a detailed schedule of the dates by which each step toward compliance will be reached; or

(iii) In the case of an affected source not in compliance with all applicable requirements established under this section, a schedule of remedial measures, including an enforceable sequence of actions or operations with milestones and a schedule for the submission of certified progress reports, where applicable, leading to compliance with a relevant standard, limitation, prohibition, or any federally enforceable requirement established pursuant to section 112 of the Act for which the affected source is not in compliance. This compliance schedule shall resemble and be at least as stringent as that contained in any judicial consent decree or administrative order to which the source is subject. Any such schedule of compliance shall be supplemental to, and shall not sanction noncompliance with, the applicable requirements on which it is based.

“Construction” means the on-site fabrication, erection, or installation of an affected source.

“Continuous emission monitoring system” (CEMS) means the total equipment that may be required to meet the data acquisition and availability requirements of this section, used to sample, condition (if applicable), analyze, and provide a record of emissions.

“Continuous monitoring system” (CMS) is a comprehensive term that may include, but is not limited to, continuous emission monitoring systems, continuous opacity monitoring systems, continuous parameter monitoring systems, or other manual or automatic monitoring that is used for demonstrating compliance with an applicable regulation on a continuous basis as defined by the regulation.

“Continuous opacity monitoring system” (COMS) means a continuous monitoring system that measures the opacity of emissions.

“Continuous parameter monitoring system” means the total equipment that may be required to meet the data acquisition and availability requirements of this section, used to sample, condition (if applicable), analyze, and provide a record of process or control system parameters.

“Effective date” means:

(i) With regard to an emission standard in this section, the date of promulgation in the Federal Register. The effective date is designated in the applicable subparts of the national emission standards for hazardous air pollutants (NESHAP) referenced in Chapter 5, Section 3(b) and contained in 40 CFR part 63, or

(ii) With regard to an alternative emission limitation or equivalent emission limitation determined by the Administrator, the date that the alternative emission limitation or equivalent emission limitation becomes effective according to the provisions of this section.

“Emission standard” means a national standard, limitation, prohibition, or other regulation promulgated in a subpart of this section pursuant to sections 112(d), 112(h), or 112(f) of the Act.

“Emissions averaging” is a way to comply with the emission limitations specified in a relevant standard, whereby an affected source, if allowed under a subpart of this section, may create emission credits by reducing emissions from specific points to a level below that required by the relevant standard, and those credits are used to offset emissions from points that are not controlled to the level required by the relevant standard.

“EPA” means the Administrator of the United States Environmental Protection Agency or the Administrator’s designee.

“Equivalent emission limitation” means the maximum achievable control technology emission limitation (MACT emission limitation) for hazardous air pollutants that the Administrator determines on a case-by-case basis, pursuant to section 112(g) or section 112(j) of the Act, to be equivalent to the emission standard that would apply to an affected source if such standard had been promulgated by the EPA under 40 CFR part 63 pursuant to section 112(d) or section 112(h) of the Act.

“Excess emissions and continuous monitoring system performance report” is a report that must be submitted periodically by an affected source in order to provide data on its compliance with relevant emission limits, operating parameters, and the performance of its continuous parameter monitoring systems.

“Existing source” means any affected source that is not a new source.

“Federally enforceable” means all limitations and conditions that are enforceable by the EPA and citizens under the Act or that are enforceable under other statutes administered by the EPA.

“Fixed capital cost” means the capital needed to provide all the depreciable components of an existing source.

“Fugitive emissions” means those emissions from a stationary source that could not reasonably pass through a stack, chimney, vent, or other functionally equivalent opening. Under section 112 of the Act, all fugitive emissions are to be considered in determining whether a stationary source is a major source.

“Hazardous air pollutant” means any air pollutant listed in or pursuant to section 112(b) of the Act, and listed in subsection (d)(ii)(A)(I) of this section.

“Issuance” of an operating permit will occur, in accordance with Chapter 6, Section 3.

“Lesser quantity” means a quantity of a hazardous air pollutant that is or may be emitted by a stationary source that the EPA establishes in order to define a major source under an applicable subpart of this section.

“Major source” means any stationary source or group of stationary sources located within a contiguous area and under common control that emits or has the potential to emit considering controls, in the aggregate, 10 tons per year or more of any hazardous air pollutant or 25 tons per year or more of any combination of hazardous air pollutants, unless the EPA establishes a lesser quantity, or in the case of radionuclides, different criteria from those specified in this sentence.

“Malfunction” means any sudden, infrequent, and not reasonably preventable failure of air pollution control equipment, process equipment, or a process to operate in a normal or usual manner. Failures that are caused in part by poor maintenance or careless operation are not malfunctions.

“New source” means any affected source the construction or reconstruction of which is commenced after the EPA first proposes a relevant emission standard under 40 CFR part 63.

“One-hour period”, unless otherwise defined in an applicable subpart, means any 60-minute period commencing on the hour.

“Opacity” means the degree to which emissions reduce the transmission of light and obscure the view of an object in the background. For continuous opacity monitoring systems, opacity means the fraction of incident light that is attenuated by an optical medium.

“Operating permit” or “part 70 permit” means any permit or group of permits covering a source under Chapter 6, Section 3 that is issued, renewed, amended, or revised pursuant to Chapter 6, Section 3.

“Owner or operator” means any person who owns, leases, operates, controls, or supervises a stationary source.

“Performance audit” means a procedure to analyze blind samples, the content of which is known by the Administrator, simultaneously with the analysis of performance test samples in order to provide a measure of test data quality.

“Performance evaluation” means the conduct of relative accuracy testing, calibration error testing, and other measurements used in validating the continuous monitoring system data.

“Performance test” means the collection of data resulting from the execution of a test method (usually three emission test runs) used to demonstrate compliance with a relevant emission standard as specified in the performance test section of the relevant standard.

“Permit modification” means a change to an operating permit as defined in Chapter 6, Section 3 of the WAQSR.

“Permit program” means the comprehensive State operating permit system established pursuant to title V of the Act (42 U.S.C. 7661) and regulations in Chapter 6, Section 3.

“Permit revision” means any permit modification or administrative permit amendment to an operating permit as defined in Chapter 6, Section 3.

“Potential to emit” means the maximum capacity of a stationary source to emit a pollutant under its physical and operational design. Any physical or operational limitation on the capacity of the stationary source to emit a pollutant, including air pollution control equipment and restrictions on hours of operation or on the type or amount of material combusted, stored, or processed, shall be treated as part of its design if the limitation or the effect it would have on emissions is federally enforceable.

“Reconstruction” means the replacement of components of an affected or a previously unaffected stationary source to such an extent that:

(i) The fixed capital cost of the new components exceeds 50 percent of the fixed capital cost that would be required to construct a comparable new source; and

(ii) It is technologically and economically feasible for the reconstructed source to meet the relevant standard(s) established by the EPA pursuant to section 112 of the Act. Upon reconstruction, an affected source, or a stationary source that becomes an affected source, is subject to relevant standards for new sources, including compliance dates, irrespective of any change in emissions of hazardous air pollutants from that source.

“Regulation promulgation schedule” means the schedule for the promulgation of emission standards under 40 CFR part 63, established by the EPA pursuant to section 112(e) of the Act and published in the Federal Register.

“Relevant standard” means:

(i) An emission standard;

(ii) An alternative emission standard;

(iii) An alternative emission limitation; or

(iv) An equivalent emission limitation established pursuant to section 112 of the Act that applies to the stationary source, the group of stationary sources, or the portion of a stationary source regulated by such standard or limitation.

A relevant standard may include or consist of a design, equipment, work practice, or operational requirement, or other measure, process, method, system, or technique (including prohibition of emissions) that the EPA establishes for new or existing sources to which such standard or limitation applies. Every relevant standard established

pursuant to section 112 of the Act includes the provisions of Chapter 5, Section 3 and all applicable appendices that are referenced in that standard.

“Responsible official” means one of the following:

(i) For a Corporation: a president, secretary, treasurer, or vice president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision-making functions for the corporation, or a duly authorized representative of such person if the representative is responsible for the overall operation of one or more manufacturing, production, or operating facilities and either:

(A) The facilities employ more than 250 persons or have gross annual sales or expenditures exceeding \$25 million (in second Quarter 1980 dollars); or

(B) The delegation of authority to such representative is approved in advance by the Administrator.

(ii) For a Partnership or Sole Proprietorship: a general partner or the proprietor, respectively.

(iii) For a Municipality, State, Federal, or Other Public Agency: either a principal executive officer or ranking elected official. For the purposes of this section, a principal executive officer of a Federal agency includes the chief executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., a Regional Administrator of the EPA).

(iv) For Affected Sources (as defined in this section) Applying for or Subject to an Operating Permit: “responsible official” shall have the same meaning as defined in Chapter 6, Section 3.

“Run” means one of a series of emission or other measurements needed to determine emissions for a representative operating period or cycle as specified in this section.

“Shutdown” means the cessation of operation of an affected source for any purpose.

“Six-minute period” means, with respect to opacity determinations, any one of the 10 equal parts of a 1-hour period.

“Standard conditions” means a temperature of 293°K (68°F) and a pressure of 101.3 Kilopascals of Hg (29.92 in. of Hg).

“Startup” means the setting in operation of an affected source for any purpose.

“State” means the State of Wyoming.

“Stationary source” means any building, structure, facility, or installation which emits or may emit any air pollutant.

“Test method” means the validated procedure for sampling, preparing, and analyzing for an air pollutant specified in a relevant standard as the performance test procedure. The test method may include methods described in an appendix of 40 CFR part 63 or methods validated for an application through procedures in Method 301 of 40 CFR part 63, Appendix A.

“Visible emission” means the observation of an emission of opacity or optical density above the threshold of vision.

“WAQSR” means the Wyoming Air Quality Standards and Regulations promulgated under the Wyoming Environmental Quality Act, W.S. §35-11-101 et seq.

(f) Units and Abbreviations. The abbreviations and symbols for the units of measure used in this section, are defined as follows:

(i) System International (SI) Units of Measure:

A = ampere

g = gram

Hz = hertz

J = joule

°K = degree Kelvin

kg = kilogram

l = liter

m = meter

m³ = cubic meter

mg = milligram = 10⁻³ gram

ml = milliliter = 10⁻³ liter

mm = millimeter = 10⁻³ meter

Mg = megagram = 10⁶ gram = metric ton

MJ = megajoule

mol = mole

N = newton

ng = nanogram = 10⁻⁹ gram

nm = nanometer = 10⁻⁹ meter

Pa = pascal

s = second

V = volt

W = watt
 Ω = ohm
 μg = microgram = 10^{-6} gram
 μl = microliter = 10^{-6} liter

(ii) Other Units of Measure:

Btu = British thermal unit
 $^{\circ}\text{C}$ = degree Celsius (centigrade)
cal = calorie
cfm = cubic feet per minute
cc = cubic centimeter
cu ft = cubic feet
d = day
dcf = dry cubic feet
dcm = dry cubic meter
dscf = dry cubic feet at standard conditions
dscm = dry cubic meter at standard conditions
eq = equivalent
 $^{\circ}\text{F}$ = degree Fahrenheit
ft = feet
 ft^2 = square feet
 ft^3 = cubic feet
gal = gallon
gr = grain
g-eq = gram equivalent
g-mole = gram mole
hr = hour
in. = inch
in. H_2O = inches of water
K = 1,000
kcal = kilocalorie
lb = pound
lpm = liter per minute
meq = milliequivalent
min = minute
MW = molecular weight
oz = ounces
ppb = parts per billion
ppbw = parts per billion by weight
ppbv = parts per billion by volume
ppm = parts per million
ppmw = parts per million by weight
ppmv = parts per million by volume
psia = pounds per square inch absolute
psig = pounds per square inch gage

°R = degree Rankine
scf = cubic feet at standard conditions
scfh = cubic feet at standard conditions per hour
scm = cubic meter at standard conditions
sec = second
sq ft = square feet
std = at standard conditions
v/v = volume per volume
yd² = square yards
yr = year

(iii) Miscellaneous:

act = actual
avg = average
I.D. = inside diameter
M = molar
N = normal
O.D. = outside diameter
% = percent

(g) Prohibited Activities and Circumvention.

(i) Prohibited Activities.

(A) No owner or operator subject to the provisions of this section shall operate any affected source in violation of the requirements of this section except under:

(I) An extension of compliance granted by the EPA under this section; or

(II) An extension of compliance granted under this section by the Administrator; or

(III) An exemption from compliance granted by the President under section 112(i)(4) of the Act.

(B) No owner or operator subject to the provisions of this section shall fail to keep records, notify, report, or revise reports as required under this section.

(C) No owner or operator of an affected source, who is required under this section to obtain an operating permit, shall operate such source except in compliance with the provisions of this section and the applicable requirements of Chapter 6, Section 3.

(D) An owner or operator of an affected source who is subject to an emission standard promulgated under this section shall comply with the requirements of that standard by the date(s) established in the applicable subpart(s) of this section regardless of whether:

(I) An operating permit has been issued to that source; or

(II) If an operating permit has been issued to that source, whether such permit has been revised or modified to incorporate the emission standard.

(ii) Circumvention. No owner or operator subject to the provisions of this section shall build, erect, install, or use any article, machine, equipment, or process to conceal an emission that would otherwise constitute noncompliance with a relevant standard. Such concealment includes, but is not limited to:

(A) The use of diluents to achieve compliance with a relevant standard based on the concentration of a pollutant in the effluent discharged to the atmosphere;

(B) The use of gaseous diluents to achieve compliance with a relevant standard for visible emissions; and

(C) The fragmentation of an operation such that the operation avoids regulation by a relevant standard.

(iii) Severability. Notwithstanding any requirement incorporated into an operating permit obtained by an owner or operator subject to the provisions of this section, the provisions of this section are federally enforceable.

(h) Compliance With Standards and Maintenance Requirements.

(i) Applicability.

(A) The requirements in this subsection apply to owners or operators of affected sources for which any relevant standard has been established pursuant to section 112 of the Act unless:

(I) The Administrator has granted an extension of compliance consistent with paragraph (viii) of this subsection; or

(II) The President has granted an exemption from compliance with any relevant standard in accordance with section 112(i)(4) of the Act.

(B) If an area source that otherwise would be subject to an emission standard or other requirement established under this section if it were a major

source subsequently increases its emissions of hazardous air pollutants (or its potential to emit hazardous air pollutants) such that the source is a major source, such source shall be subject to the relevant emission standard or other requirement.

(ii) Compliance Dates for New and Reconstructed Sources.

(A) Except as specified in paragraphs (ii)(C) and (ii)(D) of this subsection, the owner or operator of a new or reconstructed source that has an initial startup before the effective date of a relevant standard established under this section pursuant to sections 112(d), 112(f), or 112(h) of the Act shall comply with such standard not later than the standard's effective date.

(B) Except as specified in paragraphs (ii)(C) and (ii)(D) of this subsection, the owner or operator of a new or reconstructed source that has an initial startup after the effective date of a relevant standard established under this section pursuant to sections 112(d), 112(f), or 112(h) of the Act shall comply with such standard upon startup of the source.

(C) The owner or operator of an affected source for which construction or reconstruction is commenced after the proposal date of a relevant standard established under this section pursuant to sections 112(d), 112(f), or 112(h) of the Act but before the effective date (that is, promulgation) of such standard shall comply with the relevant emission standard not later than the date 3 years after the effective date if:

(I) The promulgated standard (that is, the relevant standard) is more stringent than the proposed standard; and

(II) The owner or operator complies with the standard as proposed during the 3-year period immediately after the effective date.

(D) The owner or operator of an affected source for which construction or reconstruction is commenced after the proposal date of a relevant standard established pursuant to section 112(d) of the Act but before the proposal date of a relevant standard established pursuant to section 112(f) shall comply with the emission standard under section 112(f) not later than the date 10 years after the date construction or reconstruction is commenced, except that, if the section 112(f) standard is promulgated more than 10 years after construction or reconstruction is commenced, the owner or operator shall comply with the standard as provided in paragraphs (ii)(A) and (ii)(B) of this subsection.

(E) The owner or operator of a new source that is subject to the compliance requirements of paragraph (ii)(C) or paragraph (ii)(D) of this subsection shall notify the Administrator in accordance with subsection (k)(iv) of this section.

(F) After the effective date of an emission standard promulgated under this section, the owner or operator of an unaffected new area source (i.e., an area source for which construction or reconstruction was commenced after the proposal date of the standard) that increases its emissions of (or its potential to emit) hazardous air pollutants such that the source becomes a major source that is subject to the emission standard, shall comply with the relevant emission standard immediately upon becoming a major source. This compliance date shall apply to new area sources that become affected major sources regardless of whether the new area source previously was affected by that standard. The new affected major source shall comply with all requirements of that standard that affect new sources.

(iii) Compliance Dates for Existing Sources.

(A) After the effective date of a relevant standard established under this section pursuant to section 112(d) or 112(h) of the Act, the owner or operator of an existing source shall comply with such standard by the compliance date in the applicable subpart(s) of this section. Except as otherwise provided for in section 112 of the Act, in no case will the compliance date established for an existing source in an applicable subpart of this section exceed 3 years after the effective date of such standard.

(B) After the effective date of a relevant standard established under this section pursuant to section 112(f) of the Act, the owner or operator of an existing source shall comply with such standard not later than 90 days after the standard's effective date unless the Administrator has granted an extension to the source under paragraph (viii)(D)(II) of this subsection.

(C) After the effective date of an emission standard promulgated under this section, the owner or operator of an unaffected existing area source that increases its emissions of (or its potential to emit) hazardous air pollutants such that the source becomes a major source that is subject to the emission standard shall comply by the date specified in the standard for existing area sources that become major sources. If no such compliance date is specified in the standard, the source shall have a period of time to comply with the relevant emission standard that is equivalent to the compliance period specified in that standard for other existing sources. This compliance period shall apply to existing area sources that become affected major sources regardless of whether the existing area source previously was affected by that standard. Notwithstanding the previous two sentences, however, if the existing area source becomes a major source by the addition of a new affected source or by reconstructing, the portion of the existing facility that is a new affected source or a reconstructed source shall comply with all requirements of that standard that affect new sources, including the compliance date for new sources.

(iv) Operation and Maintenance Requirements.

(A) (I) At all times, including periods of startup, shutdown, and malfunction, owners or operators shall operate and maintain any affected source, including associated air pollution control equipment, in a manner consistent with good air pollution control practices for minimizing emissions at least to the levels required by all relevant standards.

(II) Malfunctions shall be corrected as soon as practicable after their occurrence in accordance with the startup, shutdown, and malfunction plan required in paragraph (iv)(C) of this subsection.

(III) Operation and maintenance requirements established pursuant to section 112 of the Act are enforceable independent of emissions limitations or other requirements in relevant standards.

(B) Determination of whether acceptable operation and maintenance procedures are being used will be based on information available to the Administrator which may include, but is not limited to, monitoring results, review of operation and maintenance procedures [including the startup, shutdown, and malfunction plan required in paragraph (iv)(C) of this subsection], review of operation and maintenance records, and inspection of the source.

(C) Startup, Shutdown, and Malfunction Plan.

(I) The owner or operator of an affected source shall develop and implement a written startup, shutdown, and malfunction plan that describes, in detail, procedures for operating and maintaining the source during periods of startup, shutdown, and malfunction and a program of corrective action for malfunctioning process and air pollution control equipment used to comply with the relevant standard. As required under subsection (k)(iii)(A)(I), the plan shall identify all routine or otherwise predictable CMS malfunctions. This plan shall be developed by the owner or operator by the source's compliance date for that relevant standard. The plan shall be incorporated by reference into the source's operating permit. The purpose of the startup, shutdown, and malfunction plan is to:

(1.) Ensure that, at all times, owners or operators operate and maintain affected sources, including associated air pollution control equipment, in a manner consistent with good air pollution control practices for minimizing emissions at least to the levels required by all relevant standards;

(2.) Ensure that owners or operators are prepared to correct malfunctions as soon as practicable after their occurrence in order to minimize excess emissions of hazardous air pollutants; and

(3.) Reduce the reporting burden associated with periods of startup, shutdown, and malfunction (including corrective action taken to

restore malfunctioning process and air pollution control equipment to its normal or usual manner of operation).

(II) During periods of startup, shutdown, and malfunction, the owner or operator of an affected source shall operate and maintain such source (including associated air pollution control equipment) in accordance with the procedures specified in the startup, shutdown, and malfunction plan developed under paragraph (iv)(C)(I) of this subsection.

(III) When actions taken by the owner or operator during a startup, shutdown, or malfunction (including actions taken to correct a malfunction) are consistent with the procedures specified in the affected source's startup, shutdown, and malfunction plan, the owner or operator shall keep records for that event that demonstrate that the procedures specified in the plan were followed. These records may take the form of a "checklist", or other effective form of recordkeeping, that confirms conformance with the startup, shutdown, and malfunction plan for that event. In addition, the owner or operator shall keep records of these events as specified in subsection (I)(ii) (and elsewhere in this section) including records of the occurrence and duration of each startup, shutdown, or malfunction of operation and each malfunction of the air pollution control equipment. Furthermore, the owner or operator shall confirm that actions taken during the relevant reporting period during periods of startup, shutdown, and malfunction were consistent with the affected source's startup, shutdown and malfunction plan in the semiannual (or more frequent) startup, shutdown, and malfunction report required in subsection (I)(iv)(E).

(IV) If an action taken by the owner or operator during a startup, shutdown, or malfunction (including an action taken to correct a malfunction) is not consistent with the procedures specified in the affected source's startup, shutdown, and malfunction plan, the owner or operator shall record the actions taken for that event and shall report such actions with 24 hours after commencing actions inconsistent with the plan, followed by a letter within 7 working days after the end of the event, in accordance with subsection (I)(iv)(E) (unless the owner or operator makes alternative reporting arrangements, in advance, with the Administrator [see subsection (I)(iv)(E)(II)]).

(V) The owner or operator shall keep the written startup, shutdown, and malfunction plan on record after it is developed to be made available for inspection, upon request, by the Administrator for the life of the affected source or until the affected source is no longer subject to the provisions of this section. In addition, if the startup, shutdown, and malfunction plan is revised, the owner or operator shall keep previous (i.e., superseded) versions of the startup, shutdown, and malfunction plan on record, to be made available for inspection, upon request, by the Administrator, for a period of 5 years after each revision to the plan.

(VI) To satisfy the requirements of this subsection to develop a startup, shutdown, and malfunction plan, the owner or operator may use the

affected source's standard operating procedures (SOP) manual, or an Occupational Safety and Health Administration (OSHA) or other plan, provided the alternative plans meet all the requirements of this subsection and are made available for inspection when requested by the Administrator.

(VII) Based on the results of a determination made under paragraph (iv)(B) of this subsection, the Administrator may require that an owner or operator of an affected source make changes to the startup, shutdown, and malfunction plan for that source. The Administrator may require reasonable revisions to a startup, shutdown, and malfunction plan, if the Administrator finds that the plan:

- (1.) Does not address a startup, shutdown, or malfunction event that has occurred;
- (2.) Fails to provide for the operation of the source (including associated air pollution control equipment) during a startup, shutdown, or malfunction event in a manner consistent with good air pollution control practices for minimizing emissions at least to the levels required by all relevant standards; or
- (3.) Does not provide adequate procedures for correcting malfunctioning process and/or air pollution control equipment as quickly as practicable.

(VIII) If the startup, shutdown, and malfunction plan fails to address or inadequately addresses an event that meets the characteristics of a malfunction but was not included in the startup, shutdown, and malfunction plan at the time the owner or operator developed the plan, the owner or operator shall revise the startup, shutdown, and malfunction plan within 45 days after the event to include detailed procedures for operating and maintaining the source during similar malfunction events and a program of corrective action for similar malfunctions of process or air pollution control equipment.

(v) Compliance With Nonopacity Emission Standards.

(A) Applicability. The nonopacity emission standards set forth in this section shall apply at all times except during periods of startup, shutdown, and malfunction, and as otherwise specified in an applicable subpart.

(B) Methods for Determining Compliance.

(I) The Administrator will determine compliance with nonopacity emission standards in this section based on the results of performance tests conducted according to the procedures in subsection (i), unless otherwise specified in an applicable subpart of this section.

(II) The Administrator will determine compliance with nonopacity emission standards in this section by evaluation of an owner or operator's conformance with operation and maintenance requirements, including the evaluation of monitoring data, as specified in subsection (h)(iv) and applicable subparts of this section.

(III) If an affected source conducts performance testing at startup to obtain an operating permit in the State, the results of such testing may be used to demonstrate compliance with a relevant standard if:

(1.) The performance test was conducted within a reasonable amount of time before an initial performance test is required to be conducted under the relevant standard;

(2.) The performance test was conducted under representative operating conditions for the source;

(3.) The performance test was conducted and the resulting data were reduced using EPA-approved test methods and procedures, as specified in subsection (i)(v) of this section; and

(4.) The performance test was appropriately quality-assured, as specified in subsection (i)(iii) of this section.

(IV) The Administrator will determine compliance with design, equipment, work practice, or operational emission standards in this section by review of records, inspection of the source, and other procedures specified in applicable subparts of this section.

(V) The Administrator will determine compliance with design, equipment, work practice, or operational emission standards in this section by evaluation of an owner or operator's conformance with operation and maintenance requirements, as specified in paragraph (iv) of this section and applicable subparts of this section.

(C) Finding of compliance. The Administrator will make a finding concerning an affected source's compliance with a nonopacity emission standard, as specified in paragraphs (v)(A) and (v)(B) of this subsection, upon obtaining all the compliance information required by the relevant standard (including the written reports of performance test results, monitoring results, and other information, if applicable) and any information available to the Administrator needed to determine whether proper operation and maintenance practices are being used.

(vi) Use of an Alternative Nonopacity Emission Standard.

(A) If, in the EPA's judgment, an owner or operator of an affected source has established that an alternative means of emission limitation will achieve a reduction in emissions of a hazardous air pollutant from an affected source at least equivalent to the reduction in emissions of that pollutant from that source achieved under any design, equipment, work practice, or operational emission standard, or combination thereof, established under this section, pursuant to section 112(h) of the Act, the EPA will publish in the Federal Register a notice permitting the use of the alternative emission standard for purposes of compliance with the promulgated standard. Any Federal Register notice under this paragraph shall be published only after the public is notified and given the opportunity to comment. Such notice will restrict the permission to the stationary source(s) or category(ies) of sources from which the alternative emission standard will achieve equivalent emission reductions. The EPA will condition permission in such notice on requirements to assure the proper operation and maintenance of equipment and practices required for compliance with the alternative emission standard and other requirements, including appropriate quality assurance and quality control requirements, that are deemed necessary.

(B) An owner or operator requesting permission under this paragraph shall, unless otherwise specified in an applicable subpart, submit a proposed test plan or the results of testing and monitoring in accordance with subsection (i) and subsection (j), a description of the procedures followed in testing or monitoring, and a description of pertinent conditions during testing or monitoring. Any testing or monitoring conducted to request permission to use an alternative nonopacity emission standard shall be appropriately quality assured and quality controlled, as specified in subsection (i) and subsection (j).

(C) The EPA may establish general procedures in an applicable subpart that accomplish the requirements of paragraphs (vi)(A) and (vi)(B) of this subsection.

(vii) Compliance With Opacity and Visible Emission Standards.

(A) Applicability. The opacity and visible emission standards set forth in this section shall apply at all times except during periods of startup, shutdown, and malfunction, and as otherwise specified in an applicable subpart.

(B) Methods for Determining Compliance.

(I) The Administrator will determine compliance with opacity and visible emission standards in this section based on the results of the test method specified in an applicable subpart. Whenever a continuous opacity monitoring system (COMS) is required to be installed to determine compliance with numerical opacity emission standards in this section, compliance with opacity emission standards in this section shall be determined by using the results from the COMS. Whenever an opacity emission test method is not specified, compliance with opacity emission

standards in this section shall be determined by conducting observations in accordance with Test Method 9 in 40 CFR part 60, Appendix A or the method specified in paragraph (vii)(F)(II) of this subsection. Whenever a visible emission test method is not specified, compliance with visible emission standards in this section shall be determined by conducting observations in accordance with Test Method 22 in 40 CFR part 60, Appendix A.

(II) If an affected source undergoes opacity or visible emission testing at startup to obtain an operating permit in the State, the results of such testing may be used to demonstrate compliance with a relevant standard if:

(1.) The opacity or visible emission test was conducted within a reasonable amount of time before a performance test is required to be conducted under the relevant standard;

(2.) The opacity or visible emission test was conducted under representative operating conditions for the source;

(3.) The opacity or visible emission test was conducted and the resulting data were reduced using EPA-approved test methods and procedures, as specified in subsection (i)(v) of this section; and

(4.) The opacity or visible emission test was appropriately quality-assured, as specified in subsection (i)(iii) of this section.

(C) Notification of opacity or visible emission observations. The owner or operator of an affected source shall notify the Administrator in writing of the anticipated date for conducting opacity or visible emission observations in accordance with subsection (k)(vi), if such observations are required for the source by a relevant standard.

(D) Conduct of opacity or visible emission observations. When a relevant standard under this section includes an opacity or visible emission standard, the owner or operator of an affected source shall comply with the following:

(I) For the purpose of demonstrating initial compliance, opacity or visible emission observations shall be conducted concurrently with the initial performance test required in subsection (i) unless one of the following conditions applies:

(1.) If no performance test under subsection (i) is required, opacity or visible emission observations shall be conducted with 60 days after achieving the maximum production rate at which a new or reconstructed source will be operated, but not later than 120 days after initial startup of the source, or within 120 days after the effective date of the relevant standard in the case of new sources that start up before the standard's effective date. If no performance test under subsection (i) is

required, opacity or visible emission observations shall be conducted within 120 days after the compliance date for an existing or modified source; or

(2.) If visibility or other conditions prevent the opacity or visible emission observations from being conducted concurrently with the initial performance test required under subsection (i), or within the time period specified in paragraph (vii)(D)(I)(1.) of this subsection, the source's owner or operator shall reschedule the opacity or visible emission observations as soon after the initial performance test, or time period, as possible, but not later than 30 days thereafter, and shall advise the Administrator of the rescheduled date. The rescheduled opacity or visible emission observations shall be conducted (to the extent possible) under the same operating conditions that existed during the initial performance test conducted under subsection (i). The visible emissions observer shall determine whether visibility or other conditions prevent the opacity or visible emission observations from being made concurrently with the initial performance test in accordance with procedures contained in Test Method 9 or Test Method 22 in 40 CFR part 60, Appendix A.

(II) For the purpose of demonstrating initial compliance, the minimum total time of opacity observations shall be 3 hours (30 6-minute averages) for the performance test or other required set of observations (e.g., for fugitive-type emission sources subject only to an opacity emission standard).

(III) The owner or operator of an affected source to which an opacity or visible emission standard in this section applies shall conduct opacity or visible emission observations in accordance with the provisions of this subsection, record the results of the evaluation of emissions, and report to the Administrator the opacity or visible emission results in accordance with the provisions of subsection (I)(iv).

(IV) Opacity readings of portions of plumes that contain condensed, uncombined water vapor shall not be used for the purposes of determining compliance with opacity emission standards.

(E) Availability of Records. The owner or operator of an affected source shall make available, upon request by the Administrator, such records that the Administrator deems necessary to determine the conditions under which the visual observations were made and shall provide evidence indicating proof of current visible observer emission certification.

(F) Use of a Continuous Opacity Monitoring System.

(I) The owner or operator of an affected source required to use a continuous opacity monitoring system (COMS) shall record the monitoring data produced during a performance test required under subsection (i) and shall furnish the Administrator a written report of the monitoring results in accordance with the provisions of subsection (I)(v)(D).

(II) Whenever an opacity emission test method has not been specified in an applicable subpart, or an owner or operator of an affected source is required to conduct Test Method 9 observations (see 40 CFR part 60, Appendix A), the owner or operator may submit, for compliance purposes, COMS data results produced during any performance test required under subsection (l) in lieu of Method 9 data. If the owner or operator elects to submit COMS data for compliance with the opacity emission standard, the Administrator shall be notified of that decision, in writing, simultaneously with the notification under subsection (l)(ii) of the date the performance test is scheduled to begin. Once the owner or operator of an affected source has notified the Administrator to that effect, the COMS data results will be used to determine opacity compliance during subsequent performance tests required under subsection (l), unless the owner or operator notifies the Administrator in writing to the contrary not later than with the notification under subsection (l)(ii) of the date the subsequent performance test is scheduled to begin.

(III) For the purposes of determining compliance with the opacity emission standard during a performance test required under subsection (l) using COMS data, the COMS data shall be reduced to 6-minute averages over the duration of the mass emission performance test.

(IV) The owner or operator of an affected source using a COMS for compliance purposes is responsible for demonstrating compliance with the performance evaluation requirements of subsection (j)(v), that the COMS has been properly maintained, operated, and data quality-assured, as specified in subsection (j)(iii) and subsection (j)(iv), and that the resulting data have not been altered in any way.

(V) Except as provided in paragraph (vii)(F)(II) of this subsection, the results of continuous monitoring by a COMS that indicate that the opacity at the time visual observations were made was not in excess of the emission standard are probative but not conclusive evidence of the actual opacity of an emission, provided that the affected source proves that, at the time of the alleged violation, the instrument used was properly maintained, as specified in subsection (j)(iii), and met Performance Specification 1 in 40 CFR part 60, Appendix B, and that the resulting data have not been altered in any way.

(G) Finding of Compliance. The Administrator will make a finding concerning an affected source's compliance with an opacity or visible emission standard upon obtaining all the compliance information required by the relevant standard (including the written reports of the results of the performance tests required by subsection (i), the results of Test Method 9 or another required opacity or visible emission test method, the observer certification required by paragraph (vii)(E) of this subsection, and the continuous opacity monitoring system results, whichever is/are applicable) and any information available to the Administrator needed to determine whether proper operation and maintenance practices are being used.

(H) Adjustment to an Opacity Emission Standard.

(I) If the EPA finds under paragraph (vii)(G) of this subsection that an affected source is in compliance with all relevant standards for which initial performance tests were conducted under subsection (i), but during the time such performance tests were conducted fails to meet any relevant opacity emission standard, the owner or operator of such source may petition the EPA to make appropriate adjustment to the opacity emission standard for the affected source. Until the EPA notifies the owner or operator of the appropriate adjustment, the relevant opacity emission standard remains applicable.

(II) The EPA may grant such a petition upon a demonstration by the owner or operator that:

(1.) The affected source and its associated air pollution control equipment were operated and maintained in a manner to minimize the opacity of emissions during the performance tests;

(2.) The performance tests were performed under the conditions established by the EPA; and

(3.) The affected source and its associated air pollution control equipment were incapable of being adjusted or operated to meet the relevant opacity emission standard.

(III) The EPA will establish an adjusted opacity emission standard for the affected source meeting the above requirements at a level at which the source will be able, as indicated by the performance and opacity tests, to meet the opacity emission standard at all times during which the source is meeting the mass or concentration emission standard. The EPA will promulgate the new opacity emission standard in the Federal Register.

(IV) After the EPA promulgates an adjusted opacity emission standard for an affected source, the owner or operator of such source shall be subject to the new opacity emission standard, and the new opacity emission standard shall apply to such source during any subsequent performance tests.

(viii) Extension of Compliance With Emission Standards.

(A) Until an extension of compliance has been granted by the Administrator under this paragraph, the owner or operator of an affected source subject to the requirements of this subsection shall comply with all applicable requirements of this section.

(B) Extension of Compliance for Early Reductions and Other Reductions.

(I) Early Reductions. Pursuant to section 112(i)(5) of the Act, if the owner or operator of an existing source demonstrates that the source has achieved a reduction in emissions of hazardous air pollutants in accordance with the provisions of 40 CFR part 63, Subpart D, the Administrator will grant the owner or operator an extension of compliance with specific requirements of this section, as specified in 40 CFR part 63, Subpart D.

(II) Other Reductions. Pursuant to section 112(i)(6) of the Act, if the owner or operator of an existing source has installed best available control technology (BACT) [as defined in section 169(3) of the Act] or technology required to meet a lowest achievable emission rate (LAER) (as defined in section 171 of the Act) prior to the promulgation of an emission standard, applicable to such source and the same pollutant (or stream of pollutants) controlled pursuant to the BACT or LAER installation, the Administrator will grant the owner or operator an extension of compliance with such emission standard that will apply until the date 5 years after the date on which such installation was achieved, as determined by the Administrator.

(C) Request for Extension of Compliance. Paragraphs (viii)(D) through (viii)(G) of this subsection concern requests for an extension of compliance with a relevant standard under this section [except requests for an extension of compliance under paragraph (viii)(B)(I) of this subsection will be handled through procedures specified in 40 CFR part 63, Subpart D].

(D) (I) (1.) The owner or operator of an existing source who is unable to comply with a relevant standard established under this section pursuant to section 112(d) of the Act may request that the Administrator grant an extension allowing the source up to 1 additional year to comply with the standard, if such additional period is necessary for the installation of controls. An additional extension of up to 3 years may be added for mining waste operations, if the 1-year extension of compliance is insufficient to dry and cover mining waste in order to reduce emissions of any hazardous air pollutant. The owner or operator of an affected source who has requested an extension of compliance under this paragraph and who is otherwise required to obtain an operating permit shall apply for such permit or apply to have the source's operating permit revised to incorporate the conditions of the extension of compliance. The conditions of an extension of compliance granted under this paragraph will be incorporated into the affected source's operating permit according to the provisions of Chapter 6, Section 3.

(2.) Any request under this paragraph for an extension of compliance with a relevant standard shall be submitted in writing to the Administrator not later than 12 months before the affected source's compliance date [as specified in paragraphs (ii) and (iii) of this subsection] for sources that are not including

emission points in an emissions average, or not later than 18 months before the affected source's compliance date [as specified in paragraphs (ii) and (iii) of this subsection] for sources that are including emission points in an emissions average. Emission standards established under this section may specify alternative dates for the submittal of requests for an extension of compliance if alternatives are appropriate for the source categories affected by those standards, e.g., a compliance date specified by the standard is less than 12 (or 18) months after the standard's effective date.

(II) The owner or operator of an existing source unable to comply with a relevant standard established under this section pursuant to section 112(f) of the Act may request that the Administrator grant an extension allowing the source up to 2 years after the standard's effective date to comply with the standard. The Administrator may grant such an extension if it is determined that such additional period is necessary for the installation of controls and that steps will be taken during the period of the extension to assure that the health of persons will be protected from imminent endangerment. Any request for an extension of compliance with a relevant standard under this paragraph shall be submitted in writing to the Administrator not later than 15 calendar days after the effective date of the relevant standard.

(E) The owner or operator of an existing source that has installed BACT or technology required to meet LAER [as specified in paragraph (viii)(B)(II) of this subsection] prior to the promulgation of a relevant emission standard may request that the Administrator grant an extension allowing the source 5 years from the date on which such installation was achieved, as determined by the Administrator, to comply with the standard. Any request for an extension of compliance with a relevant standard under this paragraph shall be submitted in writing to the Administrator not later than 120 days after the promulgation date of the standard. The Administrator may grant such an extension if it is determined that the installation of BACT or technology to meet LAER controls the same pollutant (or stream of pollutants) that would be controlled at that source by the relevant emission standard.

(F) (I) The request for a compliance extension under paragraph (viii)(D) of this subsection shall include the following information:

(1.) A description of the controls to be installed to comply with the standard;

(2.) A compliance schedule, including the date by which each step toward compliance will be reached. At a minimum, the list of dates shall include:

a. The date by which contracts for emission control systems or process changes for emission control will be awarded, or the date by which orders will be issued for the purchase of component parts to accomplish emission control or process changes;

b. The date by which on-site construction, installation of emission control equipment, or a process change is to be initiated;

c. The date by which on-site construction, installation of emission control equipment, or a process change is to be completed; and

d. The date by which final compliance is to be achieved;

(3.) A description of interim emission control steps that will be taken during the extension period, including milestones to assure proper operation and maintenance of emission control and process equipment; and

(4.) Whether the owner or operator is also requesting an extension of other applicable requirements (e.g., performance testing requirements).

(II) The request for a compliance extension under paragraph (viii)(E) of this subsection shall include all information needed to demonstrate to the Administrator's satisfaction that the installation of BACT or technology to meet LAER controls the same pollutant (or stream of pollutants) that would be controlled at that source by the relevant emission standard.

(G) Advice on requesting an extension of compliance may be obtained from the Administrator.

(H) Approval of Request for Extension of Compliance. Paragraphs (viii)(I) through (viii)(N) of this subsection concern approval of an extension of compliance requested under paragraphs (viii)(D) through (viii)(F) of this subsection.

(I) Based on the information provided in any request made under paragraphs (viii)(D) through (viii)(F) of this subsection, or other information, the Administrator may grant an extension of compliance with an emission standard, as specified in paragraphs (viii)(D) and (viii)(E) of this subsection.

(J) The extension will be in writing and will:

(I) Identify each affected source covered by the extension;

(II) Specify the termination date of the extension;

(III) Specify the dates by which steps toward compliance are to be taken, if appropriate;

(IV) Specify other applicable requirements to which the compliance extension applies (e.g., performance tests); and

(V) (1.) Under paragraph (viii)(D), specify any additional conditions that the Administrator deems necessary to assure installation of the necessary controls and protection of the health of persons during the extension period; or

(2.) Under paragraph (viii)(E), specify any additional conditions that the Administrator deems necessary to assure the proper operation and maintenance of the installed controls during the extension period.

(K) The owner or operator of an existing source that has been granted an extension of compliance under paragraph (viii)(J) of this subsection may be required to submit to the Administrator progress reports indicating whether the steps toward compliance outlined in the compliance schedule have been reached. The contents of the progress reports and the dates by which they shall be submitted will be specified in the written extension of compliance granted under paragraph (viii)(J) of this subsection.

(L) (I) The Administrator will notify the owner or operator in writing of approval or intention to deny approval of a request for an extension of compliance within 30 calendar days after receipt of sufficient information to evaluate a request submitted under paragraph (viii)(D)(I) or (viii)(E) of this subsection. The 30-day approval or denial period will begin after the owner or operator has been notified in writing that the application is complete. The Administrator will notify the owner or operator in writing of the status of the application, that is, whether the application contains sufficient information to make a determination, within 30 calendar days after receipt of the original application and within 30 calendar days after receipt of any supplementary information that is submitted.

(II) When notifying the owner or operator that the application is not complete, the Administrator will specify the information needed to complete the application and provide notice of opportunity for the applicant to present, in writing, within 30 calendar days after notification of the incomplete application, additional information or arguments to the Administrator to enable further action on the application.

(III) Before denying any request for an extension of compliance, the Administrator will notify the owner or operator in writing of the Administrator's intention to issue the denial, together with:

(1.) Notice of the information and findings on which the intended denial is based; and

(2.) Notice of opportunity for the owner or operator to present in writing, within 15 calendar days after notification of the intended denial,

additional information or arguments to the Administrator before further action on the request.

(IV) The Administrator's final determination to deny any request for an extension will be in writing and will set forth the specific grounds on which the denial is based. The final determination will be made within 30 calendar days after presentation of additional information or argument (if the application is complete), or within 30 calendar days after the final date specified for the presentation if no presentation is made.

(M) (I) The Administrator will notify the owner or operator in writing of approval or intention to deny approval of a request for an extension of compliance within 30 calendar days after receipt of sufficient information to evaluate a request submitted under paragraph (viii)(D)(II) of this section. The 30-day approval or denial period will begin after the owner or operator has been notified in writing that the application is complete. The Administrator will notify the owner or operator in writing of the status of the application, that is, whether the application contains sufficient information to make a determination, within 15 calendar days after receipt of the original application and within 15 calendar days after receipt of any supplementary information that is submitted.

(II) When notifying the owner or operator that the application is not complete, the Administrator will specify the information needed to complete the application and provide notice of opportunity for the applicant to present, in writing, within 15 calendar days after notification of the incomplete application, additional information or arguments to the Administrator to enable further action on the application.

(III) Before denying any request for an extension of compliance, the Administrator will notify the owner or operator in writing of the Administrator's intention to issue the denial, together with:

(1.) Notice of the information and findings on which the intended denial is based; and

(2.) Notice of opportunity for the owner or operator to present in writing, within 15 calendar days after notification of the intended denial, additional information or arguments to the Administrator before further action on the request.

(IV) A final determination to deny any request for an extension will be in writing and will set forth the specific ground on which the denial is based. The final determination will be made within 30 calendar days after presentation of additional information or argument (if the application is complete), or within 30 calendar days after the final date specified for the presentation if no presentation is made.

(N) The Administrator may terminate an extension of compliance at an earlier date than specified if any specification under paragraph (viii)(J)(III) or (viii)(J)(IV) of this subsection is not met.

(O) The granting of an extension under this section shall not abrogate the Administrator's authority under §35-11-110 of the Wyoming Environmental Quality Act.

(ix) Exemption From Compliance With Emission Standards.

The President may exempt any stationary source from compliance with any relevant standard established pursuant to section 112 of the Act for a period of not more than 2 years if the President determines that the technology to implement such standard is not available and that it is in the national security interests of the United States to do so. An exemption under this paragraph may be extended for 1 or more additional periods, each period not to exceed 2 years.

(i) Performance Testing Requirements.

(i) Applicability and Performance Test Dates.

(A) Unless otherwise specified, this subsection applies to the owner or operator of an affected source required to do performance testing, or another form of compliance demonstration, under a relevant standard.

(B) If required to do performance testing by a relevant standard, and unless a waiver of performance testing is obtained under this subsection or the conditions of paragraph (iii)(C)(II)(2.) of this subsection apply, the owner or operator of the affected source shall perform such tests as follows:

(I) Within 180 days after the effective date of a relevant standard for a new source that has an initial startup date before the effective date; or

(II) Within the requirements of Chapter 6, Section 2 after initial startup for a new source that has an initial startup date after the effective date of a relevant standard; or

(III) Within 180 days after the compliance date specified in an applicable subpart of this section for an existing source subject to an emission standard established pursuant to section 112(d) of the Act, or within 180 days after startup of an existing source if the source begins operation after the effective date of the relevant emission standard; or

(IV) Within 180 days after the compliance date for an existing source subject to an emission standard established pursuant to section 112(f) of the Act; or

(V) Within 180 days after the termination date of the source's extension of compliance for an existing source that obtains an extension of compliance under subsection (i)(viii); or

(VI) Within the requirements of Chapter 6, Section 2 after the compliance date for a new source, subject to an emission standard established pursuant to section 112(f) of the Act, for which construction or reconstruction is commenced after the proposal date of a relevant standard established pursuant to section 112(d) of the Act but before the proposal date of the relevant standard established pursuant to section 112(f) [see subsection (i)(ii)(D)]; or

(VII) When an emission standard promulgated under this section is more stringent than the standard proposed [see subsection (i)(ii)(C)], the owner or operator of a new or reconstructed source subject to that standard for which construction or reconstruction is commenced between the proposal and promulgation dates of the standard shall comply with performance testing requirements within 180 days after the standard's effective date, or within 180 days after startup of the source, whichever is later. If the promulgated standard is more stringent than the proposed standard, the owner or operator may choose to demonstrate compliance with either the proposed or the promulgated standard. If the owner or operator chooses to comply with the proposed standard initially, the owner or operator shall conduct a second performance test within 3 years and 180 days after the effective date of the standard, or after startup of the source, whichever is later, to demonstrate compliance with the promulgated standard.

(C) The Administrator may require an owner or operator to conduct performance tests at the affected source at any other time when the action is authorized by §35-11-110 of the Wyoming Environmental Quality Act.

(ii) Notification of Performance Test.

(A) The owner or operator of an affected source shall notify the Administrator in writing of his or her intention to conduct a performance test at least 60 calendar days before the performance test is scheduled to begin to allow the Administrator, upon request, to review and approve the site-specific test plan required under paragraph (iii) of this subsection and to have an observer present during the test. Observation of the performance test by the Administrator is optional.

(B) In the event the owner or operator is unable to conduct the performance test on the date specified in the notification requirement specified in paragraph (ii)(A) of this subsection, due to unforeseeable circumstances beyond his or her control, the owner or operator shall notify the Administrator within 5 days prior to the

scheduled performance test date and specify the date when the performance test is rescheduled. This notification of delay in conducting the performance test shall not relieve the owner or operator of legal responsibility for compliance with any other applicable provisions of this section or with any other applicable Federal, State, or local requirement, nor will it prevent the Administrator from implementing or enforcing this section or taking any other action under the Wyoming Environmental Quality Act.

(iii) Quality Assurance Program.

(A) The results of the quality assurance program required in this paragraph will be considered by the Administrator when determining the validity of a performance test.

(B) (I) Submission of Site-Specific Test Plan. Before conducting a required performance test, the owner or operator of an affected source shall develop and, if requested by the Administrator, shall submit a site-specific test plan to the Administrator for approval. The test plan shall include a test program summary, the test schedule, data quality objectives, and both an internal and external quality assurance (QA) program. Data quality objectives are the pretest expectations of precision, accuracy, and completeness of data.

(II) The internal QA program shall include, at a minimum, the activities planned by routine operators and analysts to provide an assessment of test data precision; an example of internal QA is the sampling and analysis of replicate samples.

(III) The external QA program shall include, at a minimum, application of plans for a test method performance audit (PA) during the performance test. The PA's consist of blind audit samples provided by the Administrator and analyzed during the performance test in order to provide a measure of test data bias. The external QA program may also include systems audits that include the opportunity for on-site evaluation by the Administrator of instrument calibration, data validation, sample logging, and documentation of quality control data and field maintenance activities.

(IV) The owner or operator of an affected source shall submit the site-specific test plan to the Administrator upon the Administrator's request at least 60 calendar days before the performance test is scheduled to take place, that is, simultaneously with the notification of intention to conduct a performance test required under paragraph (ii) of this subsection, or on a mutually agreed upon date.

(V) The Administrator may request additional relevant information after the submittal of a site-specific test plan.

(C) Approval of Site-Specific Test Plan.

(I) The Administrator will notify the owner or operator of approval or intention to deny approval of the site-specific test plan (if review of the site-specific test plan is requested) within 30 calendar days after receipt of the original plan and within 30 calendar days after receipt of any supplementary information that is submitted under paragraph (iii)(C)(I)(2.) of this subsection. Before disapproving any site-specific test plan, the Administrator will notify the applicant of the Administrator's intent to disapprove the plan together with:

(1.) Notice of the information and findings on which the intended disapproval is based; and

(2.) Notice of opportunity for the owner or operator to present, within 30 calendar days after notification of the intended disapproval, additional information to the Administrator before final action on the plan.

(II) In the event that the Administrator fails to approve or disapprove the site-specific test plan within the time period specified in paragraph (iii)(C)(I) of this subsection, the following conditions shall apply:

(1.) If the owner or operator intends to demonstrate compliance using the test method(s) specified in the relevant standard, the owner or operator shall conduct the performance test within the time specified in this subsection using the specified method(s);

(2.) If the owner or operator intends to demonstrate compliance by using an alternative to any test method specified in the relevant standard, the owner or operator shall refrain from conducting the performance test until the Administrator approves the use of the alternative method when the Administrator approves the site-specific test plan (if review of the site-specific test plan is requested) or until after the alternative method is approved [see paragraph (vi) of this subsection]. If the Administrator does not approve the site-specific test plan (if review is requested) or the use of the alternative method within 30 days before the test is scheduled to begin, the performance test dates specified in paragraph (i) of this subsection may be extended such that the owner or operator shall conduct the performance test within 60 calendar days after the Administrator approves the site-specific test plan or after use of the alternative method is approved. Notwithstanding the requirements in the preceding two sentences, the owner or operator may proceed to conduct the performance test as required in this subsection (without the Administrator's prior approval of the site-specific test plan) if it is subsequently chosen to use the specified testing and monitoring methods instead of an alternative.

(III) Neither the submission of a site-specific test plan for approval, nor the Administrator's approval or disapproval of a plan, nor the Administrator's failure to approve or disapprove a plan in a timely manner shall:

(1.) Relieve an owner or operator of legal responsibility for compliance with an applicable provisions of this section or with any other applicable Federal, State, or local requirement; or

(2.) Prevent the Administrator from implementing or enforcing this section or taking any other action under the Wyoming Environmental Quality Act.

(D) (I) Performance Test Method Audit Program. The owner or operator shall analyze performance audit (PA) samples during each performance test. The owner or operator shall request performance audit materials 45 days prior to the test date. Cylinder audit gases may be obtained by contacting the Administrator.

(II) The Administrator will have sole discretion to require any subsequent remedial actions of the owner or operator based on the PA results.

(III) If the Administrator fails to provide required PA materials to an owner or operator of an affected source in time to analyze the PA samples during a performance test, the requirement to conduct a PA under this paragraph shall be waived for such source for that performance test. Waiver under this paragraph of the requirement to conduct a PA for a particular performance test does not constitute a waiver of the requirement to conduct a PA for future required performance tests.

(iv) Performance Testing Facilities. If required to do performance testing, the owner or operator of each new source and, at the request of the Administrator, the owner or operator of each existing source, shall provide performance testing facilities as follows:

(A) Sampling ports adequate for test methods applicable to such source. This includes:

(I) Constructing the air pollution control system such that volumetric flow rates and pollutant emission rates can be accurately determined by applicable test methods and procedures; and

(II) Providing a stack or duct free of cyclonic flow during performance tests, as demonstrated by applicable test methods and procedures;

(B) Safe sampling platform(s);

(C) Safe access to sampling platform(s);

(D) Utilities for sampling and testing equipment; and

(E) Any other facilities that the Administrator deems necessary for safe and adequate testing of a source.

(v) Conduct of Performance Tests.

(A) Performance tests shall be conducted under such conditions as the Administrator specifies to the owner or operator based on representative performance (i.e., performance based on normal operating conditions) of the affected source. Operations during periods of startup, shutdown, and malfunction shall not constitute representative conditions for the purpose of a performance test, nor shall emissions in excess of the level of the relevant standard during periods of startup, shutdown, and malfunction be considered a violation of the relevant standard unless otherwise specified in the relevant standard or a determination of noncompliance is made under subsection (h)(iv). Upon request, the owner or operator shall make available to the Administrator such records as may be necessary to determine the conditions of performance tests.

(B) Performance tests shall be conducted and data shall be reduced in accordance with the test methods and procedures set forth in this subsection, in each relevant standard, and, if required, in applicable appendices, unless the Administrator:

(I) Specifies or approves, in specific cases, the use of a test method with minor changes in methodology; or

(II) Approves the use of an alternative test method, the results of which the Administrator has determined to be adequate for indicating whether a specific affected source is in compliance; or

(III) Approves shorter sampling times and smaller sample volumes when necessitated by process variables or other factors; or

(IV) Waives the requirement for performance tests because the owner or operator of an affected source has demonstrated by other means to the Administrator's satisfaction that the affected source is in compliance with the relevant standard.

(C) Unless otherwise specified in a relevant standard or test method, each performance test shall consist of three separate runs using the applicable test method. Each run shall be conducted for the time and under the conditions specified in the relevant standard. For the purpose of determining compliance with a relevant standard, the arithmetic mean of the results of the three runs shall apply. Upon receiving approval from the Administrator, results of a test run may be replaced with results of an additional test run in the event that:

(I) A sample is accidentally lost after the testing team leaves the site; or

(II) Conditions occur in which one of the three runs must be discontinued because of forced shutdown; or

(III) Extreme meteorological conditions occur; or

(IV) Other circumstances occur that are beyond the owner or operator's control.

(D) Nothing in paragraphs (v)(A) through (v)(C) of this subsection shall be construed to abrogate the Administrator's authority to require testing under §35-11-110 of the Wyoming Environmental Quality Act.

(vi) Use of an Alternative Test Method.

(A) General. Until permission to use an alternative test method has been granted by the Administrator under this paragraph, the owner or operator of an affected source remains subject to the requirements of this subsection and the relevant standard.

(B) The owner or operator of an affected source required to do performance testing by a relevant standard may use an alternative test method from that specified in the standard provided that the owner or operator:

(I) Notifies the Administrator of the intention to use an alternative test method not later than with the submittal of the site-specific test plan (if requested by the Administrator) or at least 60 days before the performance test is scheduled to begin if a site-specific test plan is not submitted;

(II) Uses Method 301 in 40 CFR part 63, Appendix A to validate the alternative test method; and

(III) Submits the results of the Method 301 validation process along with the notification of intention and the justification for not using the specified test method. The owner or operator may submit the information required in this paragraph well in advance of the deadline specified in paragraph (vi)(B)(I) of this subsection to ensure a timely review by the Administrator in order to meet the performance test date specified in this subsection or the relevant standard.

(C) The Administrator will determine whether the owner or operator's validation of the proposed alternative test method is adequate when the Administrator approves or disapproves the site-specific test plan required under paragraph (iii) of this subsection. If the Administrator finds reasonable grounds to dispute the results obtained by the Method 301 validation process, the Administrator may require the use of a test method specified in a relevant standard.

(D) If the Administrator finds reasonable grounds to dispute the results obtained by an alternative test method for the purposes of demonstrating compliance with a relevant standard, the Administrator may require the use of a test method specified in a relevant standard.

(E) If the owner or operator uses an alternative test method for an affected source during a required performance test, the owner or operator of such source shall continue to use the alternative test method for subsequent performance tests at that affected source until approval is received from the Administrator to use another test method as allowed under subsection (i)(vi).

(F) Neither the validation and approval process nor the failure to validate an alternative test method shall abrogate the owner or operator's responsibility to comply with the requirements of this section.

(vii) Data Analysis, Recordkeeping, and Reporting.

(A) Unless otherwise specified in a relevant standard or test method, or as otherwise approved by the Administrator in writing, results of a performance test shall include the analysis of samples, determination of emissions, and raw data. A performance test is "completed" when field sample collection is terminated. The owner or operator of an affected source shall report the results of the performance test to the Administrator before the close of business on the 60th day following the completion of the performance test, unless specified otherwise in a relevant standard or as approved otherwise in writing by the Administrator [see subsection (k)(ix)]. The results of the performance test shall be submitted as part of the notification of compliance status required under subsection (k)(viii).

(B) For a minimum of 5 years after a performance test is conducted, the owner or operator shall retain and make available, upon request, for inspection by the Administrator the records or results of such performance test and other data needed to determine emissions from an affected source.

(viii) Waiver of Performance Tests.

(A) Until a waiver of a performance testing requirement has been granted by the Administrator under this paragraph, the owner or operator of an affected source remains subject to the requirements of this subsection.

(B) Individual performance tests may be waived upon written application to the Administrator if, in the Administrator's judgment, the source is meeting the relevant standards(s) on a continuous basis, or the source is being operated under an extension of compliance, or the owner or operator has requested an extension of compliance and the Administrator is still considering that request.

(C) Request to Waive a Performance Test.

(I) If a request is made for an extension of compliance under subsection (h)(viii), the application for a waiver of an initial performance test shall accompany the information required for the request for an extension of compliance. If no extension of compliance is requested or if the owner or operator has requested an extension of compliance and the Administrator is still considering that request, the application for a waiver of an initial performance test shall be submitted at least 60 days before the performance test if the site-specific test plan under paragraph (iii) of this section is not submitted.

(II) If an application for a waiver of a subsequent performance test is made, the application may accompany any required compliance progress report, compliance status report, or excess emissions and continuous monitoring system performance report [such as those required under subsection (h)(viii), subsection (k)(viii), and subsection (l)(v) or specified in a relevant standard or in the source's operating permit], but it shall be submitted at least 60 days before the performance test if the site-specific test plan required under paragraph (iii) of this subsection is not submitted.

(III) Any application for a waiver of a performance test shall include information justifying the owner or operator's request for a waiver, such as the technical or economic infeasibility, or the impracticality, of the affected source performing the required test.

(D) Approval of Request to Waive Performance Test. The Administrator will approve or deny a request for a waiver of a performance test made under paragraph (viii)(C) of this subsection when the Administrator:

(I) Approves or denies an extension of compliance under subsection (h)(viii)(H); or

(II) Approves or disapproves a site-specific test plan under subsection (i)(iii)(C); or

(III) Makes a determination of compliance following the submission of a required compliance status report or excess emissions and continuous monitoring systems performance report; or

(IV) Makes a determination of suitable progress towards compliance following the submission of a compliance progress report, whichever is applicable.

(E) Approval of any waiver granted under this subsection shall not abrogate the Administrator's authority under the Wyoming Environmental Quality Act or in any way prohibit the Administrator from later canceling the waiver. The cancellation will be made only after notice is given to the owner or operator of the affected source.

(j) Monitoring Requirements.

(i) Applicability.

(A) (I) Unless otherwise specified in a relevant standard, this subsection applies to the owner or operator of an affected source required to do monitoring under that standard.

(II) Relevant standards established under this section will specify monitoring systems, methods, or procedures, monitoring frequency, and other pertinent requirements for source(s) regulated by those standards. This section specifies general monitoring requirements such as those governing the conduct of monitoring and requests to use alternative monitoring methods. In addition, this subsection specifies detailed requirements that apply to affected sources required to use continuous monitoring systems (CMS) under a relevant standard.

(B) For the purposes of this section, all CMS required under relevant standards shall be subject to the provisions of this subsection upon promulgation of performance specifications for CMS as specified in the relevant standard or otherwise by the Administrator.

(C) Additional monitoring requirements for control devices used to comply with provisions in relevant standards of this section are specified in subsection (m).

(ii) Conduct of Monitoring.

(A) Monitoring shall be conducted as set forth in this subsection and the relevant standard(s) unless the Administrator:

(I) Specifies or approves the use of minor changes in methodology for the specified monitoring requirements and procedures; or

(II) Approves the use of alternatives to any monitoring requirements or procedures.

(III) Owners or operators with flares subject to subsection (m)(ii) are not subject to the requirements of this subsection unless otherwise specified in the relevant standard.

(B) (I) When the effluents from a single affected source, or from two or more affected sources, are combined before being released to the atmosphere, the owner or operator shall install an applicable CMS on each effluent.

(II) If the relevant standard is a mass emission standard and the effluent from one affected source is released to the atmosphere through more than one point, the owner or operator shall install an applicable CMS at each emission point unless the installation of fewer systems is:

(1.) Approved by the Administrator; or

(2.) Provided for in a relevant standard (e.g., instead of requiring that a CMS be installed at each emission point before the effluents from those points are channeled to a common control device, the standard specifies that only one CMS is required to be installed at the vent of the control device).

(C) When more than one CMS is used to measure the emissions from one affected source (e.g., multiple breechings, multiple outlets), the owner or operator shall report the results as required for each CMS. However, when one CMS is used as a backup to another CMS, the owner or operator shall report the results from the CMS used to meet the monitoring requirements of this section. If both such CMS are used during a particular reporting period to meet the monitoring requirements of this section, then the owner or operator shall report the results from each CMS for the relevant compliance period.

(iii) Operation and Maintenance of Continuous Monitoring Systems.

(A) The owner or operator of an affected source shall maintain and operate each CMS as specified in this subsection, or in a relevant standard, and in a manner consistent with good air pollution control practices.

(I) The owner or operator of an affected source shall ensure the immediate repair or replacement of CMS parts to correct “routine” or otherwise predictable CMS malfunctions as defined in the source’s startup, shutdown, and malfunction plan required by subsection (h)(iv)(C). The owner or operator shall keep the necessary parts for routine repairs of the affected equipment readily available. If the plan is followed and the CMS repaired immediately, this action shall be reported in the semiannual startup, shutdown, and malfunction report required under subsection (l)(iv)(E)(I).

(II) For those malfunctions or other events that affect the CMS and are not addressed by the startup, shutdown, and malfunction plan, the owner or operator shall report actions that are not consistent with the startup, shutdown, and malfunction plan within 24 hours after commencing actions inconsistent with the plan. The owner or operator shall send a follow-up report within 2 weeks after commencing

actions inconsistent with the plan that either certifies that corrections have been made or includes a corrective action plan and schedule. The owner or operator shall provide proof that repair parts have been ordered or any other records that would indicate that the delay in making repairs is beyond their control.

(III) The Administrator's determination of whether acceptable operation and maintenance procedures are being used will be based on information that may include, but is not limited to, review of operation and maintenance procedures, operation and maintenance records, manufacturing recommendations and specifications, and inspection of the CMS. Operation and maintenance procedures written by the CMS manufacturer and other guidance also can be used to maintain and operate each CMS.

(B) All CMS shall be installed such that representative measurements of emissions or process parameters from the affected source are obtained. In addition, CEMS shall be located according to procedures contained in the applicable performance specification(s).

(C) All CMS shall be installed, operational, and the data verified as specified in the relevant standard either prior to or in conjunction with conducting performance tests under subsection (i). Verification of operational status shall, at a minimum, include completion of the manufacturer's written specifications or recommendations for installation, operation, and calibration of the system.

(D) Except for system breakdowns, out-of-control periods, repairs, maintenance periods, calibration checks, and zero (low-level) and high-level calibration drift adjustments, all CMS, including COMS and CEMS, shall be in continuous operation and shall meet minimum frequency of operation requirements as follows:

(I) All COMS shall complete a minimum of one cycle of sampling and analyzing for each successive 10-second period and one cycle of data recording for each successive 6-minute period.

(II) All CEMS for measuring emissions other than opacity shall complete a minimum of one cycle of operation (sampling, analyzing, and data recording) for each successive 15-minute period.

(E) Unless otherwise approved by the Administrator, minimum procedures for COMS shall include a method for producing a simulated zero opacity condition and an upscale (high-level) opacity condition using a certified neutral density filter or other related technique to produce a known obscuration of the light beam. Such procedures shall provide a system check of all the analyzer's internal optical surfaces and all electronic circuitry, including the lamp and photodetector assembly normally used in the measurement of opacity.

(F) The owner or operator of a CMS installed in accordance with the provisions of this section and the applicable CMS performance specification(s) shall check the zero (low-level) and high-level calibration drifts at least once daily in accordance with the written procedure specified in the performance evaluation plan developed under paragraphs (v)(C)(I) and (v)(C)(II) of this subsection. The zero (low-level) and high-level calibration drifts shall be adjusted, at a minimum, whenever the 24-hour zero (low-level) drift exceeds two times the limits of the applicable performance specification(s) specified in the relevant standard. The system must allow the amount of excess zero (low-level) and high-level drift measured at the 24-hour interval checks to be recorded and quantified, whenever specified. For COMS, all optical and instrumental surfaces exposed to the effluent gases shall be cleaned prior to performing the zero (low-level) and high-level drift adjustments; the optical surfaces and instrumental surfaces shall be cleaned when the cumulative automatic zero compensation, if applicable, exceeds 4 percent opacity.

(G) (I) A CMS is out of control if:

(1.) The zero (low-level), mid-level (if applicable), or high-level calibration drift (CD) exceeds two times the applicable CD specification in the applicable performance specification or in the relevant standard; or

(2.) The CMS fails a performance test audit (e.g., cylinder gas audit), relative accuracy audit, relative accuracy test audit, or linearity test audit; or

(3.) The COMS CD exceeds two times the limit in the applicable performance specification in the relevant standard.

(II) When the CMS is out of control, the owner or operator of the affected source shall take the necessary corrective action and shall repeat all necessary tests which indicate that the system is out of control. The owner or operator shall take corrective action and conduct retesting until the performance requirements are below the applicable limits. The beginning of the out-of-control period is the hour the owner or operator conducts a performance check (e.g., calibration drift) that indicates an exceedance of the performance requirements established under this section. The end of the out-of-control period is the hour following the completion of corrective action and successful demonstration that the system is within the allowable limits. During the period the CMS is out of control, recorded data shall not be used in data averages and calculations, or to meet any data availability requirement established under this section.

(H) The owner or operator of a CMS that is out of control as defined in paragraph (iii)(G) of this subsection shall submit all information concerning out-of-control periods, including start and end dates and hours and descriptions of corrective actions taken, in the excess emissions and continuous monitoring system performance report required in subsection (I)(v)(C).

(iv) Quality Control Program.

(A) The results of the quality control program required in this paragraph will be considered by the Administrator when determining the validity of monitoring data.

(B) The owner or operator of an affected source that is required to use a CMS and is subject to the monitoring requirements of this subsection and a relevant standard shall develop and implement a CMS quality control program. As part of the quality control program, the owner or operator shall develop and submit to the Administrator for approval upon request a site-specific performance evaluation test plan for the CMS performance evaluation required in paragraph (v)(C)(I) of this subsection, according to the procedures specified in paragraph (v). In addition, each quality control program shall include, at a minimum, a written protocol that describes procedures for each of the following operations:

- (I) Initial and any subsequent calibration of the CMS;
- (II) Determination and adjustment of the calibration drift of the CMS;
- (III) Preventive maintenance of the CMS, including spare parts inventory;
- (IV) Data recording, calculations, and reporting;
- (V) Accuracy audit procedures, including sampling and analysis methods; and
- (VI) Program of corrective action for a malfunctioning CMS.

(C) The owner or operator shall keep these written procedures on record for the life of the affected source or until the affected source is no longer subject to the provisions of this section, to be made available for inspection, upon request, by the Administrator. If the performance evaluation plan is revised, the owner or operator shall keep previous (i.e., superseded) versions of the performance evaluation plan on record to be made available for inspection, upon request, by the Administrator, for a period of 5 years after each revision to the plan. Where relevant, e.g., program of corrective action for a malfunctioning CMS, these written procedures may be incorporated as part of the affected source's startup, shutdown, and malfunction plan to avoid duplication of planning and recordkeeping efforts.

(v) Performance Evaluation of Continuous Monitoring Systems.

(A) General. When required by a relevant standard, and at any other time the Administrator may require under §35-11-110 of the Wyoming Environmental Quality Act, the owner or operator of an affected source being monitored shall conduct a performance evaluation of the CMS. Such performance evaluation shall be conducted according to the applicable specifications and procedures described in this subsection or in the relevant standard.

(B) Notification of Performance Evaluation. The owner or operator shall notify the Administrator in writing of the date of the performance evaluation simultaneously with the notification of the performance test date required under subsection (i)(ii) or at least 60 days prior to the date the performance evaluation is scheduled to begin if no performance test is required.

(C) (I) Submission of Site-Specific Performance Evaluation Test Plan. Before conducting a required CMS performance evaluation, the owner or operator of an affected source shall develop and submit a site-specific performance evaluation test plan to the Administrator for approval upon request. The performance evaluation test plan shall include the evaluation program objectives, an evaluation program summary, the performance evaluation schedule, data quality objectives, and both an internal and external QA program. Data quality objectives are the pre-evaluation expectations of precision, accuracy, and completeness of data.

(II) The internal QA program shall include, at a minimum, the activities planned by routine operators and analysts to provide an assessment of CMS performance. The external QA program shall include, at a minimum, systems audits that include the opportunity for on-site evaluation by the Administrator of instrument calibration, data validation, sample logging, and documentation of quality control data and field maintenance activities.

(III) The owner or operator of an affected source shall submit the site-specific performance evaluation test plan to the Administrator (if requested) at least 60 days before the performance test or performance evaluation is scheduled to begin, or on a mutually agreed upon date, and review and approval of the performance evaluation test plan by the Administrator will occur with the review and approval of the site-specific test plan (if review of the site-specific test plan is requested).

(IV) The Administrator may request additional relevant information after the submittal of a site-specific performance evaluation test plan.

(V) In the event that the Administrator fails to approve or disapprove the site-specific performance evaluation test plan within the time period specified in subsection (i)(iii)(C), the following conditions shall apply:

(1.) If the owner or operator intends to demonstrate compliance using the monitoring method(s) specified in the relevant standard, the owner or operator shall conduct the performance evaluation within the time specified in this section using the specified method(s);

(2.) If the owner or operator intends to demonstrate compliance by using an alternative to a monitoring method specified in the relevant standard, the owner or operator shall refrain from conducting the performance evaluation until the Administrator approves the use of the alternative method. If the Administrator does not approve the use of the alternative method within 30 days before the performance evaluation is scheduled to begin, the performance evaluation deadlines specified in paragraph (v)(D) of this subsection may be extended by the Administrator. The owner or operator may proceed to conduct the performance evaluation as required in this subsection (without the Administrator's prior approval of the site-specific performance evaluation test plan) if it is subsequently chosen to use the specified monitoring method(s) instead of an alternative.

(VI) Neither the submission of a site-specific performance evaluation test plan for approval, nor the Administrator's approval or disapproval of a plan, nor the Administrator's failure to approve or disapprove a plan in a timely manner shall:

(1.) Relieve an owner or operator of legal responsibility for compliance with any applicable provisions of this section or with any other applicable Federal, State, or local requirement; or

(2.) Prevent the Administrator from implementing or enforcing this section or taking any other action under the Wyoming Environmental Quality Act.

(D) Conduct of Performance Evaluation and Performance Evaluation Dates. The owner or operator of an affected source shall conduct a performance evaluation of a required CMS during any performance test required under subsection (i) in accordance with the applicable performance specification as specified in the relevant standard. Notwithstanding the requirement in the previous sentence, if the owner or operator of an affected source elects to submit COMS data for compliance with a relevant opacity emission standard as provided under subsection (h)(vii)(F), a performance evaluation of the COMS shall be conducted as specified in the relevant standard, before the performance test required under subsection (i) is conducted in time to submit the results of the performance evaluation as specified in paragraph (v)(E)(II) of this subsection. If a performance test is not required, or the requirement for a performance test has been waived under subsection (i)(viii), the owner or operator of an affected source shall conduct the performance evaluation not later than 180 days after the appropriate compliance date for the affected source, as specified in subsection (i), or as otherwise specified in the relevant standard.

(E) Reporting Performance Evaluation Results.

(I) The owner or operator shall furnish the Administrator a copy of a written report of the results of the performance evaluation simultaneously with the results of the performance test required under subsection (i) or within 60 days of completion of the performance evaluation if no test is required, unless otherwise specified in a relevant standard. The Administrator may request that the owner or operator submit the raw data from a performance evaluation in the report of the performance evaluation results.

(II) The owner or operator of an affected source using a COMS to determine opacity compliance during any performance test required under subsection (i) and described in subsection (h)(vii)(F) shall furnish the Administrator two or, upon request, three copies of a written report of the results of the COMS performance evaluation under this paragraph. The copies shall be provided at least 15 calendar days before the performance test required under subsection (i) is conducted.

(vi) Use of an Alternative Monitoring Method.

(A) General. Until permission to use an alternative monitoring method has been granted by the Administrator under this paragraph, the owner or operator of an affected source remains subject to the requirements of this subsection and the relevant standard.

(B) After receipt and consideration of written application, the Administrator may approve alternatives to any monitoring methods or procedures of this section including, but not limited to, the following:

(I) Alternative monitoring requirements when installation of a CMS specified by a relevant standard would not provide accurate measurements due to liquid water or other interferences caused by substances within the effluent gases;

(II) Alternative monitoring requirements when the affected source is infrequently operated;

(III) Alternative monitoring requirements to accommodate CEMS that require additional measurements to correct for stack moisture conditions;

(IV) Alternative locations for installing CMS when the owner or operator can demonstrate that installation at alternate locations will enable accurate and representative measurements;

(V) Alternate methods for converting pollutant concentration measurements to units of the relevant standard;

(VI) Alternate procedures for performing daily checks of zero (low-level) and high-level drift that do not involve use of high-level gases or test cells;

(VII) Alternatives to the American Society for Testing and Materials (ASTM) test methods or sampling procedures specified by any relevant standard;

(VIII) Alternative CMS that do not meet the design or performance requirements in this section, but adequately demonstrate a definite and consistent relationship between their measurements and the measurements of opacity by a system complying with the requirements as specified in the relevant standard. The Administrator may require that such demonstration be performed for each affected source; or

(IX) Alternative monitoring requirements when the effluent from a single affected source or the combined effluent from two or more affected sources is released to the atmosphere through more than one point.

(C) If the Administrator finds reasonable grounds to dispute the results obtained by an alternative monitoring method, requirement, or procedure, the Administrator may require the use of a method, requirement, or procedure specified in this subsection or in the relevant standard. If the results of the specified and alternative method, requirement, or procedure do not agree, the results obtained by the specified method, requirement, or procedure shall prevail.

(D) (I) Request to Use Alternative Monitoring Method. An owner or operator who wishes to use an alternative monitoring method shall submit an application to the Administrator as described in paragraph (vi)(D)(II) of this subsection, below. The application may be submitted at any time provided that the monitoring method is not used to demonstrate compliance with a relevant standard or other requirement. If the alternative monitoring method is to be used to demonstrate compliance with a relevant standard, the application shall be submitted not later than with the site-specific test plan required in subsection (i)(iii) (if requested) or with the site-specific performance evaluation plan (if requested) or at least 60 days before the performance evaluation is scheduled to begin.

(II) The application shall contain a description of the proposed alternative monitoring system and a performance evaluation test plan, if required, as specified in paragraph (v)(C) of this subsection. In addition, the application shall include information justifying the owner or operator's request for an alternative monitoring method, such as the technical or economic infeasibility, or the impracticality, of the affected source using the required method.

(III) The owner or operator may submit the information required in this paragraph well in advance of the submittal dates specified in paragraph (vi)(D)(I) above to ensure a timely review by the Administrator in order to meet the compliance demonstration date specified in this subsection or the relevant standard.

(E) Approval of Request to Use Alternative Monitoring Method.

(I) The Administrator will notify the owner or operator of approval or intention to deny approval of the request to use an alternative monitoring method within 30 calendar days after receipt of the original request and within 30 calendar days after receipt of any supplementary information that is submitted. Before disapproving any request to use an alternative monitoring method, the Administrator will notify the applicant of the Administrator's intention to disapprove the request together with:

(1.) Notice of the information and findings on which the intended disapproval is based; and

(2.) Notice of opportunity for the owner or operator to present additional information to the Administrator before final action on the request. At the time the Administrator notifies the applicant of the intention to disapprove the request, the Administrator will specify how much time the owner or operator will have after being notified of the intended disapproval to submit the additional information.

(II) The Administrator may establish general procedures and criteria in a relevant standard to accomplish the requirements of paragraph (vi)(E)(I) of this subsection.

(III) If the Administrator approves the use of an alternative monitoring method for an affected source under paragraph (vi)(E)(I) of this subsection, the owner or operator of such source shall continue to use the alternative monitoring method until approval is received from the Administrator to use another monitoring method as allowed by subsection (j)(vi).

(F) Alternative to the Relative Accuracy Test. An alternative to the relative accuracy test for CEMS specified in a relevant standard may be requested as follows:

(I) Criteria for Approval of Alternative Procedures. An alternative to the test method for determining relative accuracy is available for affected sources with emission rates demonstrated to be less than 50 percent of the relevant standard. The owner or operator of an affected source may petition the Administrator under paragraph (vi)(F)(II) of this subsection to substitute the relative accuracy test in section 7 of Performance Specification 2 with the procedures in section 10 if the results of a performance test conducted according to the requirements in subsection (i), or other

tests performed following the criteria in subsection (i), demonstrate that the emission rate of the pollutant of interest in the units of the relevant standard is less than 50 percent of the relevant standard. For affected sources subject to emission limitations expressed as control efficiency levels, the owner or operator may petition the Administrator to substitute the relative accuracy test with the procedures in section 10 of Performance Specification 2 if the control device exhaust emission rate is less than 50 percent of the level needed to meet the control efficiency requirement. The alternative procedures do not apply if the CEMS is used continuously to determine compliance with the relevant standard.

(II) Petition to Use Alternative to Relative Accuracy Test.

The petition to use an alternative to the relative accuracy test shall include a detailed description of the procedures to be applied, the location and the procedure for conducting the alternative, the concentration or response levels of the alternative relative accuracy materials, and the other equipment checks included in the alternative procedure(s). The Administrator will review the petition for completeness and applicability. The Administrator's determination to approve an alternative will depend on the intended use of the CEMS data and may require specifications more stringent than in Performance Specification 2.

(III) Rescission of Approval to Use Alternative to Relative Accuracy Test. The Administrator will review the permission to use an alternative to the CEMS relative accuracy test and may rescind such permission if the CEMS data from a successful completion of the alternative relative accuracy procedure indicate that the affected source's emissions are approaching the level of the relevant standard. The criterion for reviewing the permission is that the collection of CEMS data shows that emissions have exceeded 70 percent of the relevant standard for any averaging period, as specified in the relevant standard. For affected sources subject to emission limitations expressed as control efficiency levels, the criterion for reviewing the permission is that the collection of CEMS data shows that exhaust emissions have exceeded 70 percent of the level needed to meet the control efficiency requirement for any averaging period, as specified in the relevant standard. The owner or operator of the affected source shall maintain records and determine the level of emissions relative to the criterion for permission to use an alternative for relative accuracy testing. If this criterion is exceeded, the owner or operator shall notify the Administrator within 10 days of such occurrence and include a description of the nature and cause of the increased emissions. The Administrator will review the notification and may rescind permission to use an alternative and require the owner or operator to conduct a relative accuracy test of the CEMS as specified in section 7 of Performance Specification 2.

(vii) Reduction of Monitoring Data.

(A) The owner or operator of each CMS shall reduce the monitoring data as specified in this paragraph. In addition, each relevant standard may contain additional requirements for reducing monitoring data. When additional

requirements are specified in a relevant standard, the standard will identify any unnecessary or duplicated requirements in this paragraph that the owner or operator need not comply with.

(B) The owner or operator of each COMS shall reduce all data to 6-minute averages calculated from 36 or more data points equally spaced over each 6-minute period. Data from CEMS for measurement other than opacity, unless otherwise specified in the relevant standard, shall be reduced to 1-hour averages computed from four or more data points equally spaced over each 1-hour period, except during periods when calibration, quality assurance, or maintenance activities pursuant to provisions of this section are being performed. During these periods, a valid hourly average shall consist of at least two data points with each representing a 15-minute period. Alternatively, an arithmetic or integrated 1-hour average of CEMS data may be used. Time periods for averaging are defined in subsection (e).

(C) The data may be recorded in reduced or nonreduced form (e.g., ppm pollutant and percent O₂ or ng/J of pollutant).

(D) All emission data shall be converted into units of the relevant standard for reporting purposes using the conversion procedures specified in that standard. After conversion into units of the relevant standard, the data may be rounded to the same number of significant digits as used in that standard to specify the emission limit (e.g., rounded to the nearest 1 percent opacity).

(E) Monitoring data recorded during periods of unavoidable CMS breakdowns, out-of-control periods, repairs, maintenance periods, calibration checks, and zero (low-level) and high-level adjustments shall not be included in any data average computed under this section.

(k) Notification Requirements.

(i) Applicability and General Information.

(A) The requirements in this subsection apply to owners and operators of affected sources that are subject to the provisions of this section, unless specified otherwise in a relevant standard.

(B) For affected sources that have been granted an extension of compliance under 40 CFR part 63, Subpart D, the requirements of this subsection do not apply to those sources while they are operating under such compliance extensions.

(C) The owner or operator of an affected source, which is subject to the notification requirements shall submit notifications to the Administrator. The owner or operator shall send a copy of each notification submitted to the Administrator to the appropriate regional office of the EPA, to satisfy the requirements of this section for

that notification. The regional office may waive this requirement for any notifications at its discretion.

(ii) Initial Notifications.

(A) (I) The requirements of this paragraph apply to the owner or operator of an affected source when such source becomes subject to a relevant standard.

(II) If an area source that otherwise would be subject to an emission standard or other requirement established under this section if it were a major source subsequently increases its emissions of hazardous air pollutants (or its potential to emit hazardous air pollutants) such that the source is a major source that is subject to the emission standard or other requirement, such source shall be subject to the notification requirements of this subsection.

(III) Affected sources that are required under this paragraph to submit an initial notification may use the application for approval of construction or reconstruction under Chapter 6, Section 5(a)(iii), if relevant, to fulfill the initial notification requirements of this paragraph.

(B) The owner or operator of an affected source that has an initial startup before the effective date of a relevant standard under this section shall notify the Administrator in writing that the source is subject to the relevant standard. The notification, which shall be submitted not later than 120 calendar days after the effective date of the relevant standard (or within 120 calendar days after the source becomes subject to the relevant standard), shall provide the following information:

(I) The name and address of the owner or operator;

(II) The address (i.e., physical location) of the affected source;

(III) An identification of the relevant standard, or other requirement, that is the basis of the notification and the source's compliance date;

(IV) A brief description of the nature, size, design, and method of operation of the source, including its operating design capacity and an identification of each point of emission for each hazardous air pollutant, or if a definitive identification is not yet possible, a preliminary identification of each point of emission for each hazardous air pollutant; and

(V) A statement of whether the affected source is a major source or an area source.

(C) The owner or operator of a new or reconstructed affected source, or a source that has been reconstructed such that it is an affected source, that has an initial startup after the effective date of a relevant standard under this section and for which an application for approval of construction or reconstruction is not required under Chapter 6, Section 5(a)(iii), shall notify the Administrator in writing that the source is subject to the relevant standard no later than 120 after initial startup. The notification shall provide all the information required in paragraphs (ii)(B)(I) through (ii)(B)(V) of this subsection, delivered or postmarked with the notification required in paragraph (ii)(E).

(D) The owner or operator of a new or reconstructed major affected source that has an initial startup after the effective date of a relevant standard under this section and for which an application for approval of construction or reconstruction is required under Chapter 6, Section 5(a)(iii) shall provide the following information in writing to the Administrator:

(I) A notification of intention to construct a new major affected source, reconstruct a major affected source, or reconstruct a major source such that the source becomes a major affected source with the application for approval of construction or reconstruction as specified in Chapter 6, Section 5(a)(iii)(A)(I);

(II) A notification of the date when construction or reconstruction was commenced, submitted simultaneously with the application for approval of construction or reconstruction, if construction or reconstruction was commenced before the effective date of the relevant standard;

(III) A notification of the date when construction or reconstruction was commenced, delivered or postmarked not later than 30 days after such date, if construction or reconstruction was commenced after the effective date of the relevant standard;

(IV) A notification of the anticipated date of startup of the source, delivered or postmarked not more than 60 days nor less than 30 days before such date; and

(V) A notification of the actual date of startup of the source, delivered or postmarked within 15 calendar days after that date.

(E) After the effective date of any relevant standard under this section, an owner or operator who intends to construct a new affected source or reconstruct an affected source subject to such standard, or reconstruct a source such that it becomes an affected source subject to such standard, shall notify the Administrator, in writing, of the intended construction or reconstruction. The notification shall be submitted as soon as practicable before the construction or reconstruction is planned to commence (but no sooner than the effective date of the relevant standard) if the

construction or reconstruction commences after the effective date of a relevant standard promulgated in this section. The notification shall be submitted as soon as practicable before startup but no later than 60 days after the effective date of a relevant standard promulgated in this section if the construction or reconstruction had commenced and initial startup had not occurred before the standard's effective date. The notification shall include all the information required for an application for approval of construction or reconstruction as specified in Chapter 6, Section 5(a)(iii). For major sources, the application for approval of construction or reconstruction may be used to fulfill the requirements of this paragraph.

(iii) Request for Extension of Compliance. If the owner or operator of an affected source cannot comply with a relevant standard by the applicable compliance date for that source, or if the owner or operator has installed BACT or technology to meet LAER consistent with subsection (h)(viii)(E) of this section a request for an extension of compliance may be submitted to the Administrator as specified in subsection (h)(viii)(D) through subsection (h)(viii)(F).

(iv) Notification That Source is Subject to Special Compliance Requirements. An owner or operator of a new source that is subject to special compliance requirements as specified in subsection (h)(ii)(C) and subsection (h)(ii)(D) shall notify the Administrator of the compliance obligations not later than the notification dates established in paragraph (ii) of this subsection for new sources that are not subject to the special provisions.

(v) Notification of Performance Test. The owner or operator of an affected source shall notify the Administrator in writing of the intention to conduct a performance test at least 60 calendar days before the performance test is scheduled to begin to allow the Administrator to review and approve the site-specific test plan required under subsection (i)(iii), if requested by the Administrator, and to have an observer present during the test.

(vi) Notification of Opacity and Visible Emission Observations. The owner or operator of an affected source shall notify the Administrator in writing of the anticipated date for conducting the opacity or visible emission observations specified in subsection (h)(vii)(D), if such observations are required for the source by a relevant standard. The notification shall be submitted with the notification of the performance test date, as specified in paragraph (v) of this subsection, or if no performance test is required or visibility or other conditions prevent the opacity or visible emission observations from being conducted concurrently with the initial performance test required under subsection (i), the owner or operator shall deliver or postmark the notification not less than 30 days before the opacity or visible emission observations are scheduled to take place.

(vii) Additional Notification Requirements for Sources With Continuous Monitoring Systems. The owner or operator of an affected source required to use a CMS by a relevant standard shall furnish the Administrator written notification as follows:

(A) A notification of the date the CMS performance evaluation under subsection (j)(v) is scheduled to begin, submitted simultaneously with the notification of the performance test date required under subsection (i)(ii). If no performance test is required, or if the requirement to conduct a performance test has been waived for an affected source under subsection (i)(viii), the owner or operator shall notify the Administrator in writing of the date of the performance evaluation at least 60 calendar days before the evaluation is scheduled to begin;

(B) A notification that COMS data results will be used to determine compliance with the applicable opacity emission standard during a performance test required by subsection (i) in lieu of Method 9 or other opacity emissions test method data, as allowed by subsection (h)(vii)(F)(II), if compliance with an opacity emission standard is required for the source by a relevant standard. The notification shall be submitted at least 60 calendar days before the performance test is scheduled to begin; and

(C) A notification that the criterion necessary to continue use of an alternative to relative accuracy testing, as provided by subsection (j)(vi)(F), has been exceeded. The notification shall be delivered or postmarked not later than 10 days after the occurrence of such exceedance, and it shall include a description of the nature and cause of the increased emissions.

(viii) Notification of Compliance Status.

(A) The requirements of paragraphs (viii)(B) through (viii)(C) of this subsection apply when an affected source becomes subject to a relevant standard.

(B) (I) Before an operating permit has been issued to the owner or operator of an affected source, and each time a notification of compliance status is required under this section, the owner or operator of such source shall submit to the Administrator a notification of compliance status, signed by the responsible official who shall certify its accuracy, attesting to whether the source has complied with the relevant standard. The notification shall list:

(1.) The methods that were used to determine compliance;

(2.) The results of any performance tests, opacity or visible emission observations, continuous monitoring system (CMS) performance evaluations, and/or other monitoring procedures or methods that were conducted;

(3.) The methods that will be used for determining continuing compliance, including a description of monitoring and reporting requirements and test methods;

(4.) The type and quantity of hazardous air pollutants emitted by the source (or surrogate pollutants if specified in the relevant standard), reported in units and averaging times and in accordance with the test methods specified in the relevant standard;

(5.) An analysis demonstrating whether the affected source is a major source or an area source (using the emissions data generated for this notification);

(6.) A description of the air pollution control equipment (or method) for each emission point, including each control device (or method) for each hazardous air pollutant and the control efficiency (percent) for each control device (or method); and

(7.) A statement by the owner or operator of the affected existing, new, or reconstructed source as to whether the source has complied with the relevant standard or other requirements.

(II) The notification shall be sent before the close of business on the 60th day following the completion of the relevant compliance demonstration activity specified in the relevant standard (unless a different reporting period is specified in a relevant standard, in which case the letter shall be sent before the close of business on the day the report of the relevant testing or monitoring results is required to be delivered or postmarked). For example, the notification shall be sent before close of business on the 60th (or other required) day following completion of the initial performance test and again before the close of business on the 60th (or other required) day following the completion of any subsequent required performance test. If no performance test is required but opacity or visible emission observations are required to demonstrate compliance with an opacity or visible emission standard under this section, the notification of compliance status shall be sent before close of business on the 30th day following the completion of opacity or visible emission observations.

(C) After an operating permit has been issued to the owner or operator of an affected source, the owner or operator of such source shall comply with all requirements for compliance status reports contained in the source's operating permit, including reports required under this section. After an operating permit has been issued to the owner or operator of an affected source, and each time a notification of compliance status is required under this section, the owner or operator of such source shall submit the notification of compliance status to the Administrator following completion of the relevant compliance demonstration activity specified in the relevant standard.

(D) If an owner or operator of an affected source submits estimates or preliminary information in the application for approval of construction or reconstruction required in Chapter 6, Section 5(a)(iii) in place of the actual emissions data

or control efficiencies required in paragraphs (iii)(A)(II)(8.) and (iii)(B) of Chapter 6, Section 5(a), the owner or operator shall submit the actual emissions data and other correct information as soon as available but no later than with the initial notification of compliance status required in this subsection.

(E) Advice on a notification of compliance status may be obtained from the Administrator.

(ix) Adjustment to Time Periods or Postmark Deadlines for Submittal and Review of Required Communications.

(A) (I) Until an adjustment of a time period or postmark deadline has been approved by the Administrator under paragraphs (ix)(B) and (ix)(C) of this subsection, the owner or operator of an affected source remains strictly subject to the requirements of this section.

(II) An owner or operator shall request the adjustment provided for in paragraphs (ix)(B) and (ix)(C) of this subsection each time changes to an applicable time period or postmark deadline specified in this section, are necessary.

(B) Notwithstanding time period or postmark deadlines specified in this section for the submittal of information to the Administrator by an owner or operator, or the review of such information by the Administrator, such time periods or deadlines may be changed by mutual agreement between the owner or operator and the Administrator. An owner or operator who wishes to request a change in a time period or postmark deadline for a particular requirement shall request the adjustment in writing as soon as practicable before the subject activity is required to take place. The owner or operator shall include in the request any information considered useful to convince the Administrator that an adjustment is warranted.

(C) If, in the Administrator's judgment, an owner or operator's request for an adjustment to a particular time period or postmark deadline is warranted, the Administrator will approve the adjustment. The Administrator will notify the owner or operator in writing of approval or disapproval of the request for an adjustment within 15 calendar days of receiving sufficient information to evaluate the request.

(D) If the Administrator is unable to meet a specified deadline, the owner or operator will be notified of any significant delay and inform the owner or operator of the amended schedule.

(x) Change in Information Already Provided. Any change in the information already provided under this subsection shall be provided to the Administrator in writing within 15 calendar days after the change.

(l) Recordkeeping and Reporting Requirements.

(i) Applicability and General Information.

(A) The requirements of this subsection apply to owners or operators of affected sources who are subject to the provisions of this section, unless specified otherwise in a relevant standard.

(B) For affected sources that have been granted an extension of compliance under 40 CFR part 63 Subpart D, the requirements of this subsection do not apply to those sources while they are operating under such compliance extensions.

(C) The owner or operator of an affected source, subject to the recordkeeping and reporting requirements shall submit reports to the Administrator. In addition, the owner or operator shall send a copy of each report submitted to the state to the appropriate regional office of the EPA, to satisfy the requirements of this subsection for that report. The regional office may waive this requirement for any reports at its discretion.

(D) Each owner or operator required to install a continuous monitoring system shall submit a written report of excess emissions (as defined in applicable subparts) to the Administrator for every calendar quarter.

(E) Periodic reports shall be submitted to the Administrator on the following schedules:

(I) All quarterly reports shall be postmarked by the 30th day following the end of each calendar quarter.

(II) All semi-annual reports required in this section and the associated subparts, shall be postmarked by the 30th day following the end of each calendar half.

(F) For each relevant standard established pursuant to section 112 of the Act, the schedule for submitting periodic reports applies beginning 1 year after the affected source's compliance date for that standard. Procedures governing the implementation of this provision are specified in subsection (k)(ix).

(G) If an owner or operator supervises one or more stationary sources affected by more than one standard established pursuant to section 112 of the Act, it may be arranged by mutual agreement between the owner or operator and the Administrator a common schedule on which periodic reports required for each source shall be submitted throughout the year. The allowance in the previous sentence applies beginning 1 year after the latest compliance date for any relevant standard established pursuant to section 112 of the Act for any such affected source(s). Procedures governing the implementation of this provision are specified in subsection (k)(ix).

(H) If an owner or operator supervises one or more stationary sources affected by standards established pursuant to section 112 of the Act (as amended November 15, 1990) and standards set under 40 CFR part 60, and/or 40 CFR part 61, it may be arranged by mutual agreement between the owner or operator and the Administrator for a common schedule on which periodic reports required by each relevant (i.e., applicable) standard shall be submitted throughout the year. The allowance in the previous sentence applies beginning 1 year after the stationary source is required to be in compliance with the relevant section 112 standard, or 1 year after the stationary source is required to be in compliance with the applicable part 60 or part 61 standard, whichever is latest. Procedures governing the implementation of this provision are specified in subsection (k)(ix).

(ii) General Recordkeeping Requirements.

(A) The owner or operator of an affected source subject to the provisions of this section shall maintain files of all information (including all reports and notifications) required by this section recorded in a form suitable and readily available for expeditious inspection and review. The files shall be retained for at least 5 years following the date of each occurrence, measurement, maintenance, corrective action, report, or record. At a minimum, the most recent 2 years of data shall be retained on site. The remaining 3 years of data may be retained off site. Such files may be maintained on microfilm, on a computer, on computer floppy disks, on magnetic tape disks, or on microfiche.

(B) The owner or operator of an affected source subject to the provisions of this section shall maintain relevant records for such source of:

(I) The occurrence and duration of each startup, shutdown, or malfunction of operation (i.e., process equipment);

(II) The occurrence and duration of each malfunction of the air pollution control equipment;

(III) All maintenance performed on the air pollution control equipment;

(IV) Actions taken during periods of startup, shutdown, and malfunction (including corrective actions to restore malfunctioning process and air pollution control equipment to its normal or usual manner of operation) when such actions are different from the procedures specified in the affected source's startup, shutdown, and malfunction plan [see subsection (h)(iv)(C)];

(V) All information necessary to demonstrate conformance with the affected source's startup, shutdown, and malfunction plan [see subsection (h)(iv)(C)] when all actions taken during period of startup, shutdown, and malfunction

(including corrective actions to restore malfunctioning process and air pollution control equipment to its normal or usual manner of operation) are consistent with the procedures specified in such plan. (The information needed to demonstrate conformance with the startup, shutdown, and malfunction plan may be recorded using a “checklist”, or some other effective form of recordkeeping, in order to minimize the recordkeeping burden for conforming events);

(VI) Each period during which a CMS is malfunctioning or inoperative (including out-of-control periods);

(VII) All required measurements needed to demonstrate compliance with a relevant standard (including, but not limited to, 15-minute averages of CMS data, raw performance testing measurements, and raw performance evaluation measurements, that support data that the source is required to report);

(VIII) All results of performance tests, CMS performance evaluations, and opacity and visible emission observations;

(IX) All measurements as may be necessary to determine the conditions of performance tests and performance evaluations;

(X) All CMS calibration checks;

(XI) All adjustments and maintenance performed on CMS;

(XII) Any information demonstrating whether a source is meeting the requirements for a waiver of recordkeeping or reporting requirements under this section, if the source has been granted a waiver under paragraph (vi) of this subsection;

(XIII) All emission levels relative to the criterion for obtaining permission to use an alternative to the relative accuracy test, if the source has been granted such permission under subsection (j)(vi)(F); and

(XIV) All documentation supporting initial notifications and notifications of compliance status under subsection (k).

(C) Recordkeeping Requirement for Applicability Determinations.

If an owner or operator determines that his or her stationary source that emits (or has the potential to emit, without considering controls) one or more hazardous air pollutants is not subject to a relevant standard or other requirement established under this section, the owner or operator shall keep a record of the applicability determination on site at the source for a period of 5 years after the determination, or until the source changes its operations to become an affected source, whichever comes first. The record of the applicability determination shall include an analysis (or other information) that

demonstrates why the owner or operator believes the source is unaffected (e.g., because the source is an area source). The analysis (or other information) shall be sufficiently detailed to allow the Administrator to make a finding about the source's applicability status with regard to the relevant standard or other requirement. If relevant, the analysis shall be performed in accordance with requirements established in subparts of this section for this purpose for particular categories of stationary sources. If relevant, the analysis should be performed in accordance with EPA guidance materials published to assist sources in making applicability determinations under section 112, if any.

(iii) Additional Recordkeeping Requirements for Sources With Continuous Monitoring Systems. In addition to complying with the requirements specified in paragraphs (ii)(A) and (ii)(B) of this subsection, the owner or operator of an affected source required to install a CMS by a relevant standard shall maintain records for such source of:

(A) All required CMS measurements (including monitoring data recorded during unavoidable CMS breakdowns and out-of-control periods);

(B) The date and time identifying each period during which the CMS was inoperative except for zero (low-level) and high-level checks;

(C) The date and time identifying each period during which the CMS was out of control, as defined in subsection (j)(iii)(G);

(D) The specific identification (i.e., the date and time of commencement and completion) of each period of excess emissions and parameter monitoring exceedances, as defined in the relevant standard(s), that occurs during startups, shutdowns, and malfunctions of the affected source;

(E) The specific identification (i.e., the date and time of commencement and completion) of each time period of excess emissions and parameter monitoring exceedances, as defined in the relevant standard(s), that occurs during periods other than startups, shutdowns, and malfunctions of the affected source;

(F) The nature and cause of any malfunction (if known);

(G) The corrective action taken or preventive measures adopted;

(H) The nature of the repairs or adjustments to the CMS that was inoperative or out of control;

(I) The total process operating time during the reporting period;

and

(J) All procedures that are part of a quality control program developed and implemented for CMS under subsection (j)(iv).

(K) In order to satisfy the requirements of paragraphs (iii)(F) through (iii)(H) of this subsection and to avoid duplicative recordkeeping efforts, the owner or operator may use the affected source's startup, shutdown, and malfunction plan or records kept to satisfy the recordkeeping requirements of the startup, shutdown, and malfunction plan specified in subsection (h)(iv), provided that such plan and records adequately address the requirements of paragraphs (iii)(F) through (iii)(H).

(iv) General Reporting Requirements.

(A) Notwithstanding the requirements in this paragraph or paragraph (v) of this subsection, the owner or operator of an affected source subject to reporting requirements under this section shall submit reports to the Administrator in accordance with the reporting requirements in the relevant standard(s).

(B) Reporting Results of Performance Tests. The results of any performance test performed as required in subsection (i) of Chapter 5, Section 3, or as required in the applicable subparts of 40 CFR part 63 shall be submitted to the Administrator. The owner or operator of an affected source shall report the results of the performance test before the close of business on the 60th day following the completion of the performance test, unless specified otherwise in a relevant standard or as approved otherwise in writing by the Administrator. The results of the performance test shall be submitted as part of the notification of compliance status required under subsection (k)(viii).

(C) Reporting Results of Opacity or Visible Emission Observations. The owner or operator of an affected source required to conduct opacity or visible emission observations by a relevant standard shall report the opacity or visible emission results (produced using Test Method 9 or Test Method 22, or an alternative to these test methods) along with the results of the performance test required under subsection (i). If no performance test is required, or if visibility or other conditions prevent the opacity or visible emission observations from being conducted concurrently with the performance test required under subsection (i), the owner or operator shall report the opacity or visible emission results before the close of business on the 30th day following the completion of the opacity or visible emission observations.

(D) Progress Reports. The owner or operator of an affected source who is required to submit progress reports as a condition of receiving an extension of compliance under subsection (h)(viii) shall submit such reports to the Administrator by the dates specified in the written extension of compliance.

(E) (I) Periodic Startup, Shutdown, and Malfunction Reports. If actions taken by an owner or operator during a startup, shutdown, or malfunction of an

affected source (including actions taken to correct a malfunction) are consistent with the procedures specified in the source's startup, shutdown, and malfunction plan [see subsection (h)(iv)(C)], the owner or operator shall state such information in a startup, shutdown, and malfunction report. Reports shall only be required if a startup, shutdown, or malfunction occurred during the reporting period. The startup, shutdown, and malfunction report shall consist of a letter, containing the name, title, and signature of the owner or operator or other responsible official who is certifying its accuracy, that shall be submitted to the Administrator semiannually (or on a more frequent basis if specified otherwise in a relevant standard or as established otherwise by the Administrator in the source's operating permit). The startup, shutdown, and malfunction report shall be delivered or postmarked by the 30th day following the end of each calendar half (or other calendar reporting period, as appropriate). If the owner or operator is required to submit excess emissions and continuous monitoring system performance (or other periodic) reports under this section, the startup, shutdown, and malfunction reports required under this paragraph may be submitted simultaneously with the excess emissions and continuous monitoring system performance (or other) reports. If startup, shutdown, and malfunction reports are submitted with excess emissions and continuous monitoring system performance (or other periodic) reports, and the owner or operator receives approval to reduce the frequency of reporting for the latter under paragraph (v) of this subsection, the frequency of reporting for the startup, shutdown, and malfunction reports also may be reduced if the Administrator does not object to the intended change. The procedures to implement the allowance in the preceding sentence shall be the same as the procedures specified in paragraph (v)(C) of this subsection.

(II) Immediate Startup, Shutdown, and Malfunction

Reports. Notwithstanding the allowance to reduce the frequency of reporting for periodic startup, shutdown, and malfunction reports under paragraph (iv)(E)(I) of this subsection, any time an action taken by an owner or operator during a startup, shutdown, or malfunction (including actions taken to correct a malfunction) is not consistent with the procedures specified in the affected source's startup, shutdown, and malfunction plan, the owner or operator shall report the actions taken for that event within 24 hours of the malfunction followed by a letter within 7 working days after the end of the event. The immediate report required under this paragraph shall consist of a telephone call (or facsimile [FAX] transmission) to the Administrator within 24 hours of the malfunction, and it shall be followed by a letter, delivered or postmarked within 7 working days after the end of the event, that contains the name, title, and signature of the owner or operator or other responsible official who is certifying its accuracy, explaining the circumstances of the event, the reasons for not following the startup, shutdown, and malfunction plan, and whether any excess emissions and/or parameter monitoring exceedances are believed to have occurred. Procedures governing the arrangement of alternative reporting requirements under this paragraph are specified in subsection (k)(ix). Alternative reporting requirements may be established as allowed by the source's operating permit.

(v) Additional Reporting Requirements for Sources With Continuous Monitoring Systems.

(A) General. When more than one CEMS is used to measure the emissions from one affected source (e.g., multiple breechings, multiple outlets), the owner or operator shall report the results as required for each CEMS.

(B) Reporting Results of Continuous Monitoring System Performance Evaluations.

(I) The owner or operator of an affected source required to install a CMS by a relevant standard shall furnish the Administrator a copy of a written report of the results of the CMS performance evaluation, as required under subsection (j)(v), simultaneously with the results of the performance test required under subsection (i), unless otherwise specified in the relevant standard.

(II) The owner or operator of an affected source using a COMS to determine opacity compliance during any performance test required under subsection (i) and described in subsection (h)(vii)(F) shall furnish the Administrator two or, upon request, three copies of a written report of the results of the COMS performance evaluation conducted under subsection (j)(v). The copies shall be furnished at least 15 calendar days before the performance test required under subsection (i) is conducted.

(C) Excess Emissions and Continuous Monitoring System Performance Report and Summary Report.

(I) Excess emissions and parameter monitoring exceedances are defined in relevant standards. The owner or operator of an affected source required to install a CMS by a relevant standard shall submit an excess emissions and continuous monitoring system performance report and/or a summary report to the Administrator semiannually, except when:

(1.) More frequent reporting is specifically required by a relevant standard;

(2.) The Administrator determines on a case-by-case basis that more frequent reporting is necessary to accurately assess the compliance status of the source; or

(3.) The CMS data are to be used directly for compliance determination and the source experienced excess emissions, in which case quarterly reports shall be submitted. Once a source reports excess emissions, the source shall follow a quarterly reporting format until a request to reduce reporting frequency under paragraph (v)(C)(II) of this subsection is approved.

(II) Request to Reduce Frequency of Excess Emissions and Continuous Monitoring System Performance Reports. Notwithstanding the frequency of

reporting requirements specified in paragraph (v)(C)(I) of this subsection, an owner or operator who is required by a relevant standard to submit excess emissions and continuous monitoring system performance (and summary) reports on a quarterly (or more frequent) basis may reduce the frequency of reporting for that standard to semiannual if the following conditions are met:

(1.) For 1 full year (e.g., 4 quarterly or 12 monthly reporting periods) the affected source's excess emissions and continuous monitoring system performance reports continually demonstrate that the source is in compliance with the relevant standard;

(2.) The owner or operator continues to comply with all recordkeeping and monitoring requirements specified in this section and the relevant standard;

(3.) The Administrator does not object to a reduced frequency of reporting for the affected source, as provided in paragraph (v)(C)(III) of this subsection, and

(4.) The operating permit for the source allows the reduction in frequency of reporting.

(III) The frequency of reporting of excess emissions and continuous monitoring system performance (and summary) reports required to comply with a relevant standard may be reduced only after the owner or operator notifies the Administrator in writing of his or her intention to make such a change and the Administrator does not object to the intended change. In deciding whether to approve a reduced frequency of reporting, the Administrator may review information concerning the source's entire previous performance history during the 5-year recordkeeping period prior to the intended change, including performance test results, monitoring data, and evaluations of an owner or operator's conformance with operation and maintenance requirements. Such information may be used by the Administrator to make a judgment about the source's potential for noncompliance in the future. The Administrator will notify the owner or operator of the approval or disapproval of the request to reduce the frequency of reporting in writing within 45 days after receiving notice of the owner or operator's intention. The notification from the Administrator to the owner or operator will specify the grounds on which a disapproval is based.

(IV) As soon as CMS data indicate that the source is not in compliance with any emission limitation or operating parameter specified in the relevant standard, the frequency of reporting shall revert to the frequency specified in the relevant standard, and the owner or operator shall submit an excess emissions and continuous monitoring system performance (and summary) report for the noncomplying emission points at the next appropriate reporting period following the noncomplying event. After demonstrating ongoing compliance with the relevant standard for another full year, the

owner or operator may again request approval from the Administrator to reduce the frequency of reporting for that standard, as provided for in paragraphs (v)(C)(II) and (v)(C)(III) of this subsection.

(V) Content and Submittal Dates for Excess Emissions and Monitoring System Performance Reports. All excess emissions and monitoring system performance reports and all summary reports, if required, shall be delivered or postmarked by the 30th day following the end of each calendar half or quarter, as appropriate. Written reports of excess emissions or exceedances of process or control system parameters shall include all the information required in paragraphs (iii)(B) through (iii)(I) of this subsection, in subsection (j)(iii)(G) and subsection (j)(iii)(H), and in the relevant standard, and they shall contain the name, title, and signature of the responsible official who is certifying the accuracy of the report. When no excess emissions or exceedances of a parameter have occurred, or a CMS has not been inoperative, out of control, repaired, or adjusted, such information shall be stated in the report.

(VI) Summary Report. As required under paragraphs (v)(C)(VII) and (v)(C)(VIII) of this subsection, one summary report shall be submitted for the hazardous air pollutants monitored at each affected source (unless the relevant standard specifies that more than one summary report is required, e.g., one summary report for each hazardous air pollutant monitored). The summary report shall be entitled “Summary Report - Gaseous and Opacity Excess Emission and Continuous Monitoring System Performance” and shall contain the following information:

- (1.) The company name and address of the affected source;
- (2.) An identification of each hazardous air pollutant monitored at the affected source;
- (3.) The beginning and ending dates of the reporting period;
- (4.) A brief description of the process units;
- (5.) The emission and operating parameter limitations specified in the relevant standards(s);
- (6.) The monitoring equipment manufacturer(s) and model number(s);
- (7.) The date of the latest CMS certification or audit;

(8.) The total operating time of the affected source during the reporting period;

(9.) An emission data summary (or similar summary if the owner or operator monitors control system parameters), including the total duration of excess emissions during the reporting period (recorded in minutes for opacity and hours for gases), the total duration of excess emissions expressed as a percent of the total source operating time during that reporting period, and a breakdown of the total duration of excess emissions during the reporting period into those that are due to startup/shutdown, control equipment problems, process problems, other known causes, and other unknown causes;

(10.) A CMS performance summary (or similar summary if the owner or operator monitors control system parameters), including the total CMS downtime during the reporting period (recorded in minutes for opacity and hours for gases), the total duration of CMS downtime expressed as a percent of the total source operating time during that reporting period, and a breakdown of the total CMS downtime during the reporting period into periods that are due to monitoring equipment malfunctions, nonmonitoring equipment malfunctions, quality assurance/quality control calibrations, other known causes, and other unknown causes;

(11.) A description of any changes in CMS, processes, or controls since the last reporting period;

(12.) The name, title, and signature of the responsible official who is certifying the accuracy of the report; and

(13.) The date of the report.

(VII) If the total duration of excess emissions or process or control system parameter exceedances for the reporting period is less than 1 percent of the total operating time for the reporting period, and CMS downtime for the reporting period is less than 5 percent of the total operating time for the reporting period, only the summary report shall be submitted, and the full excess emissions and continuous monitoring system performance report need not be submitted unless required by the Administrator.

(VIII) If the total duration of excess emissions or process or control system parameter exceedances for the reporting period is 1 percent or greater of the total operating time for the reporting period, or the total CMS downtime for the reporting period is 5 percent or greater of the total operating time for the reporting period, both the summary report and the excess emissions and continuous monitoring system performance report shall be submitted.

(D) Reporting Continuous Opacity Monitoring System Data Produced During a Performance Test. The owner or operator of an affected source required to use a COMS shall record the monitoring data produced during a performance test required under subsection (i) and shall furnish the Administrator a written report of the monitoring results. The report of COMS data shall be submitted simultaneously with the report of the performance test results required in paragraph (iv)(B) of this subsection.

(vi) Waiver of Recordkeeping or Reporting Requirements.

(A) Until a waiver of a recordkeeping or reporting requirement has been granted by the Administrator under this paragraph, the owner or operator of an affected source remains subject to the requirements of this subsection.

(B) Recordkeeping or reporting requirements may be waived upon written application to the Administrator if, in the Administrator's judgment, the affected source is achieving the relevant standard(s), or the source is operating under an extension of compliance, or the owner or operator has requested an extension of compliance and the Administrator is still considering that request.

(C) If an application for a waiver of recordkeeping or reporting is made, the application shall accompany the request for an extension of compliance under subsection (h)(viii), any required compliance progress report or compliance status report required under this section [such as under subsection (h)(viii) and subsection (k)(viii)] or in the source's operating permit, or an excess emissions and continuous monitoring system performance report required under paragraph (v) of this subsection, whichever is applicable. The application shall include whatever information the owner or operator considers useful to convince the Administrator that a waiver of recordkeeping or reporting is warranted.

(D) The Administrator will approve or deny a request for a waiver of recordkeeping or reporting requirements under this paragraph when the Administrator:

(I) Approves or denies an extension of compliance; or

(II) Makes a determination of compliance following the submission of a required compliance status report or excess emissions and continuous monitoring systems performance report; or

(III) Makes a determination of suitable progress towards compliance following the submission of a compliance progress report, whichever is applicable, and

(IV) It is determined that the Administrator is capable of waiving these requirements under the source's operating permit in accordance with Chapter 6, Section 3.

(E) A waiver of any recordkeeping or reporting requirement granted under this paragraph may be conditioned on other recordkeeping or reporting requirements deemed necessary by the Administrator.

(F) Approval of any waiver granted under this subsection shall not abrogate the Administrator's authority under the Wyoming Environmental Quality Act or in any way prohibit the Administrator from later canceling the waiver. The cancellation will be made only after notice is given to the owner or operator of the affected source.

(m) Control Device Requirements.

(i) Applicability. This subsection contains requirements for control devices used to comply with provisions in relevant standards. These requirements apply only to affected sources covered by relevant standards referring directly or indirectly to this subsection.

(ii) Flares.

(A) Owners or operators using flares to comply with the provisions of this section shall monitor these control devices to assure that they are operated and maintained in conformance with their designs. Applicable subparts will provide provisions stating how owners or operators using flares shall monitor these control devices.

(B) Flares shall be steam-assisted, air-assisted, or non-assisted.

(C) Flares shall be operated at all times when emissions may be vented to them.

(D) Flares shall be designed for and operated with no visible emissions, except for periods not to exceed a total of 5 minutes during any 2 consecutive hours. Test Method 22 in 40 CFR part 60, Appendix A shall be used to determine the compliance of flares with the visible emission provisions of this section. The observation period is 2 hours and shall be used according to Method 22.

(E) Flares shall be operated with a flame present at all times. The presence of a flare pilot flame shall be monitored using a thermocouple or any other equivalent device to detect the presence of a flame.

(F) Flares shall be used only with the net heating value of the gas being combusted at 11.2 MJ/scm (300 Btu/scf) or greater if the flare is steam-assisted or air-assisted; or with the net heating value of the gas being combusted at 7.45 MJ/scm (Btu/scf) or greater if the flare is non-assisted. The net heating value of the gas being combusted in a flare shall be calculated using the following equation:

$$H_T = K \sum_{i=1}^n C_i H_i$$

Where:

H_T = Net heating value of the sample, MJ/scm; where the net enthalpy per mole of offgas is based on combustion at 25°C and 760 mm Hg, but the standard temperature for determining the volume corresponding to one mole is 20°C.

$$K = \text{Constant} = 1.740 \times 10^{-7} \left(\frac{1}{\text{ppmv}} \right) \left(\frac{\text{g-mole}}{\text{scm}} \right) \left(\frac{\text{MJ}}{\text{kcal}} \right)$$

where the standard temperature for (g-mole/scm) is 20°C.

C_i = Concentration of sample component i in ppmv on a wet basis, as measured for organics by Test Method 18 and measured for hydrogen and carbon monoxide by American Society for Testing and Materials (ASTM) D1946-90 (2006) Standard Practice for Analysis of Reformed Gas by Gas Chromatography.

H_i = Net heat of combustion of sample component i, kcal/g-mole at 25°C and 760 mm Hg. The heats of combustion may be determined using ASTM D4809-00 (2005) Standard Test Method for Heat of Combustion of Liquid Hydrocarbon Fuels by Bomb Calorimeter (Precision Method) if published values are not available or cannot be calculated.

n = Number of sample components.

(G) (I) Steam-assisted and nonassisted flares shall be designed for and operated with an exit velocity less than 18.3 m/sec (60 ft/sec), except as provided in paragraphs (ii)(G)(II) and (ii)(G)(III) of this subsection. The actual exit velocity of a flare shall be determined by dividing by the volumetric flow rate of gas being combusted (in units of emission standard temperature and pressure), as determined by Test Methods 2, 2A, 2C, or 2D in 40 CFR part 60, Appendix A, as appropriate, by the unobstructed (free) cross-sectional area of the flare tip.

(II) Steam-assisted and nonassisted flares designed for and operated with an exit velocity, as determined by the method specified in paragraph (ii)(G)(I) of this subsection, equal to or greater than 18.3 m/sec (60 ft/sec) but less than 122 m/sec (400 ft/sec), are allowed if the net heating value of the gas being combusted is greater than 37.3 MJ/scm (1,000 Btu/scf).

(III) Steam-assisted and nonassisted flares designed for and operated with an exit velocity, as determined by the method specified in paragraph (ii)(G)(I) of this subsection, less than the velocity V_{\max} , as determined by the method specified in this paragraph, but less than 122 m/sec (400 ft/sec) are allowed. The maximum permitted velocity, V_{\max} , for flares complying with this paragraph shall be determined by the following equation:

$$\text{Log}_{10}(V_{\max}) = \frac{H_T + 28.80}{31.7}$$

Where:

V_{\max} = Maximum permitted velocity, m/sec.

28.8 = Constant.

31.7 = Constant.

H_T = The net heating value as determined in paragraph (ii)(F) of this subsection.

(H) Air-assisted flares shall be designed and operated with an exit velocity less than the velocity V_{\max} . The maximum permitted velocity, V_{\max} , for air-assisted flares shall be determined by the following equation:

$$V_{\max} = 8.706 + 0.7084(H_T)$$

Where:

V_{\max} = Maximum permitted velocity, m/sec.

8.706 = Constant.

0.7084 = Constant.

H_T = The net heating value as determined in paragraph (ii)(F) of this subsection.

(n) Availability of Information and Confidentiality.

(i) Availability of Information.

(A) With the exception of information protected through sections 35-11-1101(a) and 35-11-205(d) of the Wyoming Environmental Quality Act and subsection (n)(ii), all reports, records, and other information collected by the Administrator under this section, are available to the public. In addition, a copy of each permit application, compliance plan (including the schedule of compliance), notification of compliance status, excess emissions and continuous monitoring systems performance report, and operating permit is available to the public, consistent with protections recognized in section 205(d) of the Wyoming Environmental Quality Act.

(B) The availability to the public of information provided to or otherwise obtained by the Administrator under this section shall be governed by section 35-11-1101 and section 205(d) of the Wyoming Environmental Quality Act.

(ii) Confidentiality.

(A) As provided in sections 35-11-1101(a) and 35-11-205(d) of the Wyoming Environmental Quality Act, upon a satisfactory showing that records, reports or information or particular parts thereof, other than emission and pollution data, if made public would divulge trade secrets, the records, reports or information or particular portions thereof shall be treated as confidential by the Administrator. The Administrator may also request that the applicant provide this information directly to the EPA.

(I) An applicant who submits information which is desired to be held confidential may do so by stamping the information as “CONFIDENTIAL” and submitting it in a separate envelope marked “CONFIDENTIAL”.

(B) The contents of an operating permit shall not be entitled to protection under this subsection; however, information submitted as part of an application for an operating permit may be entitled to protection from disclosure.

Section 4. Incorporation by reference.

(a) Code of Federal Regulations (CFR). All Code of Federal Regulations (CFRs), including their Appendices, cited in this Chapter, revised and published as of July 1, 2008, not including any later amendments, are incorporated by reference. Copies of the Code of Federal Regulations are available for public inspection and copies can be obtained at cost from the Department of Environmental Quality, Division of Air Quality, 122 W. 25th Street, Cheyenne, Wyoming 82002. Copies of the CFRs can also be obtained at cost from Government Institutes, 15200 NBN Way, Building B, Blue Ridge Summit, PA 17214.

(b) American Society for Testing and Materials (ASTM). All ASTM standards cited in this Chapter, revised and published as of July 1, 2008, not including any later amendments, are incorporated by reference. Copies of the ASTM standards are available for public inspection and copies can be obtained at cost from the Department of Environmental Quality, Division of Air Quality, 122 W. 25th Street, Cheyenne, Wyoming 82002. Copies can also be obtained at cost from the American Society for Testing and Materials, 100 Barr Harbor Drive, Post Office Box C700, West Conshohocken, PA 19428-2959.

Section 3.	National emission standards for hazardous air pollutants.....	5-38
Section 4.	Incorporation by reference	5-126

**WYOMING DEPARTMENT OF ENVIRONMENTAL QUALITY
AIR QUALITY DIVISION
STANDARDS AND REGULATIONS**

National Emission Standards

CHAPTER 5

Section 1. Introduction to national emission standards.

(a) This Chapter incorporates emission control regulations developed by the Environmental Protection Agency for specific source categories. The State of Wyoming, Air Quality Division adopts these Federal Regulations in order to maintain administrative authority with regards to the standards. Section 2 contains New Source Performance Standards (NSPS) which regulate criteria pollutant emissions from specific categories of new sources. Section 3 contains National Emission Standards for Hazardous Air Pollutants (NESHAP) which regulates hazardous air pollutant emissions from specific categories of new and existing sources. Section 4 incorporates by reference all Code of Federal Regulations (CFRs), including their Appendices, cited in this Chapter and all American Society for Testing and Materials (ASTM) standards cited in this Chapter.

Section 2. New source performance standards.

(a) General: The U.S. Environmental Protection Agency regulations on Standards of Performance for New Stationary Sources, designated in Chapter 5, Section 2(b) and as amended by the word or phrase “substitutions” given in Chapter 5, Section 2(c), are incorporated into these regulations. The specific documents containing the complete text of the regulations are found in 40 CFR part 60.

(b) Designated Standards of Performance: The following Standards of Performance are incorporated by reference under Section 4(a) of this Chapter.

40 CFR part 60, Subpart D -	Standards of Performance for Fossil-Fuel-Fired Steam Generators for Which Construction is Commenced After August 17, 1971
40 CFR part 60, Subpart Da -	Standards of Performance for Electric Utility Steam Generating Units for Which Construction is Commenced After September 18, 1978
40 CFR part 60, Subpart Db -	Standards of performance for Industrial-Commercial-Institutional Steam Generating Units

40 CFR part 60, Subpart Dc -	Standards of Performance for Small Industrial-Commercial-Institutional Steam Generating Units
40 CFR part 60, Subpart E -	Standards of Performance for Incinerators
40 CFR part 60, Subpart Ea -	Standards of Performance for Municipal Waste Combustors for Which Construction is Commenced After December 20, 1989 and on or Before September 20, 1994
40 CFR part 60, Subpart Eb -	Standards of Performance for Large Municipal Waste Combustors for Which Construction is Commenced After September 20, 1994 or for Which Modification or Reconstruction is Commenced After June 19, 1996
40 CFR part 60, Subpart Ec -	Standards of Performance for Hospital/Medical/Infectious Waste Incinerators for Which Construction is Commenced After June 20, 1996
40 CFR part 60, Subpart F -	Standards of Performance for Portland Cement Plants
40 CFR part 60, Subpart G -	Standards of Performance for Nitric Acid Plants
40 CFR part 60, Subpart H -	Standards of Performance for Sulfuric Acid Plants
40 CFR part 60, Subpart I -	Standards of Performance for Hot Mix Asphalt Facilities
40 CFR part 60, Subpart J -	Standards of Performance for Petroleum Refineries
<u>40 CFR part 60, Subpart Ja -</u>	<u>Standards of Performance for Petroleum Refineries for Which Construction, Reconstruction, or Modification Commenced After May 14, 2007</u>

40 CFR part 60, Subpart K -	Standards of Performance for Storage Vessels for Petroleum Liquids for Which Construction, Reconstruction, or Modification Commenced After June 11, 1973, and Prior to May 19, 1978
40 CFR part 60, Subpart Ka -	Standards of Performance for Storage Vessels for Petroleum Liquids for Which Construction, Reconstruction, or Modification Commenced After May 18, 1978, and Prior to July 23, 1984
40 CFR part 60, Subpart Kb -	Standards of Performance for Volatile Organic Liquid Storage Vessels (Including Petroleum Liquid Storage Vessels) for Which Construction, Reconstruction, or Modification Commenced After July 23, 1984
40 CFR part 60, Subpart L -	Standards of Performance for Secondary Lead Smelters
40 CFR part 60, Subpart M -	Standards of Performance for Secondary Brass and Bronze Production Plants
40 CFR part 60, Subpart N -	Standards of Performance for Primary Emissions from Basic Oxygen Process Furnaces for Which Construction is Commenced After June 11, 1973
40 CFR part 60, Subpart Na -	Standards of Performance for Secondary Emissions from Basic Oxygen Process Steelmaking Facilities for Which Construction is Commenced After January 20, 1983
40 CFR part 60, Subpart O -	Standards of Performance for Sewage Treatment Plants
40 CFR part 60, Subpart P -	Standards of Performance for Primary Copper Smelters
40 CFR part 60, Subpart Q -	Standards of Performance for Primary Zinc Smelters

40 CFR part 60, Subpart R -	Standards of Performance for Primary Lead Smelters
40 CFR part 60, Subpart S -	Standards of Performance for Primary Aluminum Reduction Plants
40 CFR part 60, Subpart T -	Standards of Performance for the Phosphate Fertilizer Industry: Wet-Process Phosphoric Acid Plants
40 CFR part 60, Subpart U -	Standards of Performance for the Phosphate Fertilizer Industry: Superphosphoric Acid Plants
40 CFR part 60, Subpart V -	Standards of Performance for the Phosphate Fertilizer Industry: Diammonium Phosphate Plants
40 CFR part 60, Subpart W -	Standards of Performance for the Phosphate Fertilizer Industry: Triple Superphosphate Plants
40 CFR part 60, Subpart X -	Standards of Performance for the Phosphate Fertilizer Industry: Granular Triple Superphosphate Storage Facilities
40 CFR part 60, Subpart Y -	Standards of Performance for Coal Preparation Plants
40 CFR part 60, Subpart Z -	Standards of Performance for Ferroalloy Production Facilities
40 CFR part 60, Subpart AA -	Standards of Performance for Steel Plants: Electric Arc Furnaces Constructed After October 21, 1974 and on or Before August 17, 1983
40 CFR part 60, Subpart AAa -	Standards of Performance for Steel Plants: Electric Arc Furnaces and Argon-Oxygen Decarburization Vessels Constructed After August 17, 1983
40 CFR part 60, Subpart BB -	Standards of Performance for Kraft Pulp Mills

40 CFR part 60, Subpart CC -	Standards of Performance for Glass Manufacturing Plants
40 CFR part 60, Subpart DD -	Standards of Performance for Grain Elevators
40 CFR part 60, Subpart EE -	Standards of Performance for Surface Coating of Metal Furniture
40 CFR part 60, Subpart GG -	Standards of Performance for Stationary Gas Turbines
40 CFR part 60, Subpart HH -	Standards of Performance for Lime Manufacturing Plants
40 CFR part 60, Subpart KK -	Standards of Performance for Lead-Acid Battery Manufacturing Plants
40 CFR part 60, Subpart LL -	Standards of Performance for Metallic Mineral Processing Plants
40 CFR part 60, Subpart MM -	Standards of Performance for Automobile and Light-Duty Truck Surface Coating Operations
40 CFR part 60, Subpart NN -	Standards of Performance for Phosphate Rock Plants
40 CFR part 60, Subpart PP -	Standards of Performance for Ammonium Sulfate Manufacture
40 CFR part 60, Subpart QQ -	Standards of Performance for the Graphic Arts Industry: Publication Rotogravure Printing
40 CFR part 60, Subpart RR -	Standards of Performance for Pressure Sensitive Tape and Label Surface Coating Operations
40 CFR part 60, Subpart SS -	Standards of Performance for Industrial Surface Coating: Large Appliances
40 CFR part 60, Subpart TT -	Standards of Performance for Metal Coil Surface Coating

40 CFR part 60, Subpart UU -	Standards of Performance for Asphalt Processing and Asphalt Roofing Manufacture
40 CFR part 60, Subpart VV -	Standards of Performance for Equipment Leaks of VOC in the Synthetic Organic Chemicals Manufacturing Industry <u>for Which Construction, Reconstruction, or Modification Commenced After January 5, 1981, and on or Before November 7, 2006</u>
<u>40 CFR part 60, Subpart VVa -</u>	<u>Standards of Performance for Equipment Leaks of VOC in the Synthetic Organic Chemicals Manufacturing Industry for Which Construction, Reconstruction, or Modification Commenced After November 7, 2006</u>
40 CFR part 60, Subpart WW -	Standards of Performance for the Beverage Can Surface Coating Industry
40 CFR part 60, Subpart XX -	Standards of Performance for Bulk Gasoline Terminals
40 CFR part 60, Subpart AAA -	Standards of Performance for New Residential Wood Heaters
40 CFR part 60, Subpart BBB -	Standards of Performance for the Rubber Tire Manufacturing Industry
40 CFR part 60, Subpart DDD -	Standards of Performance for Volatile Organic Compound (VOC) Emissions from the Polymer Manufacturing Industry
40 CFR part 60, Subpart FFF -	Standards of Performance for Flexible Vinyl and Urethane Coating and Printing
40 CFR part 60, Subpart GGG -	Standards of Performance for Equipment Leaks of VOC in Petroleum Refineries <u>for Which Construction, Reconstruction, or Modification Commenced After January 4, 1983, and on or Before November 7, 2006</u>
<u>40 CFR part 60, Subpart GGGa -</u>	<u>Standards of Performance for Equipment Leaks of VOC in Petroleum Refineries for</u>

Which Construction, Reconstruction, or
Modification Commenced After November
7, 2006

40 CFR part 60, Subpart HHH -	Standards of Performance for Synthetic Fiber Production Facilities
40 CFR part 60, Subpart III -	Standards of Performance for Volatile Organic Compound (VOC) Emissions From the Synthetic Organic Chemical Manufacturing Industry (SOCMI) Air Oxidation Unit Processes
40 CFR part 60, Subpart JJJ -	Standards of Performance for Petroleum Dry Cleaners
40 CFR part 60, Subpart KKK -	Standards of Performance for Equipment Leaks of VOC From Onshore Natural Gas Processing Plants
40 CFR part 60, Subpart LLL -	Standards of Performance for Onshore Natural Gas Processing: SO ₂ Emissions
40 CFR part 60, Subpart NNN -	Standards of Performance for Volatile Organic Compound (VOC) Emissions From Synthetic Organic Chemical Manufacturing Industry (SOCMI) Distillation Operations
40 CFR part 60, Subpart OOO -	Standards of Performance for Nonmetallic Mineral Processing Plants
40 CFR part 60, Subpart PPP -	Standards of Performance for Wool Fiberglass Insulation Manufacturing Plants
40 CFR part 60, Subpart QQQ -	Standards of Performance for VOC Emissions From Petroleum Refinery Wastewater Systems
40 CFR part 60, Subpart RRR -	Standards of Performance for Volatile Organic Compound Emissions from Synthetic Organic Chemical Manufacturing Industry (SOCMI) Reactor Processes
40 CFR part 60, Subpart SSS -	Standards of Performance for Magnetic Tape Coating Facilities

40 CFR part 60, Subpart TTT -	Standards of Performance for Industrial Surface Coating: Surface Coating of Plastic Parts for Business Machines
40 CFR part 60, Subpart UUU -	Standards of Performance for Calciners and Dryers in Mineral Industries
40 CFR part 60, Subpart VVV -	Standards of Performance for Polymeric Coating of Supporting Substrates Facilities
40 CFR part 60, Subpart WWW -	Standards of Performance for Municipal Solid Waste Landfills
40 CFR part 60, Subpart AAAA -	Standards of Performance for Small Municipal Waste Combustion Units for Which Construction is Commenced After August 30, 1999 or for Which Modification or Reconstruction is Commenced After June 6, 2001
40 CFR part 60, Subpart CCCC -	Standards of Performance for Commercial and Industrial Solid Waste Incineration Units for Which Construction is Commenced After November 30, 1999 or for Which Modification or Reconstruction is Commenced on or After June 1, 2001
40 CFR part 60, Subpart EEEE -	Standards of Performance for Other Solid Waste Incineration Units for Which Construction is Commenced After December 9, 2004, or for Which Modification or Reconstruction is Commenced on or After June 16, 2006
<u>40 CFR part 60, Subpart IIII -</u>	<u>Standards of Performance for Stationary Compression Ignition Internal Combustion Engines</u>
<u>40 CFR part 60, Subpart JJJJ -</u>	<u>Standards of Performance for Stationary Spark Ignition Internal Combustion Engines</u>
<u>40 CFR part 60, Subpart KKKK -</u>	<u>Standards of Performance for Stationary Combustion Turbines</u>

(i) Designated Appendices. The following appendices are incorporated by reference under Section 4(a) of this Chapter.

40 CFR part 60, Appendix A - Test Methods

40 CFR part 60, Appendix B - Performance Specifications

40 CFR part 60, Appendix C - Determination of Emission Rate Change

40 CFR part 60, Appendix D - Required Emission Inventory Information

40 CFR part 60, Appendix F - Quality Assurance Procedures

40 CFR part 60, Appendix I - Removable Label and Owner's Manual

(c) Word or Phrase Substitutions: In the standards designated in Chapter 5, Section 2(b) substitute:

- (i) Chapter 5, Section 2 for Subpart A
- (ii) Chapter 5, Section 2(h) for 60.8
- (iii) Chapter 5, Section 2(g) for 60.7
- (iv) Chapter 5, Section 2(m) for 60.18
- (v) Chapter 5, Section 2(e)(i) for 60.2
- (vi) Chapter 5, Section 2(e)(ii) for 60.3
- (vii) Chapter 5, Section 2(i) for 60.11
- (viii) Chapter 5, Section 2(j) for 60.13
- (ix) Chapter 5, Section 2(k) for 60.14
- (x) Chapter 5, Section 2(l) for 60.15
- (xi) Chapter 6, Section 2(b)(i) for 60.5 and 60.6
- (xii) Chapter 6, Section 2(i) for 60.7(a)(2) and (3)
- (xiii) Chapter 6, Section 2(j) for 60.8(a) and (d)
- (xiv) Section 35-11-1101 Environmental Quality Act for 60.9
- (xv) Chapter 1, Section 4 for 60.12
- (xvi) Chapter 5, Section 2(n) for 60.19

(d) Applicability: The provisions of Chapter 5, Section 2 are applicable to the owner or operator of any stationary source which contains an affected facility, the construction or modification of which is commenced after the effective date of publication of any proposed standard as designated in the applicable subparts of the Standards of Performance referenced in Chapter 5, Section 2(b) and contained in 40 CFR part 60.

(i) In addition to complying with the provisions of this section, the Owner or Operator of an affected facility may be required to obtain an operating permit issued to stationary sources by the Administrator pursuant to Title V of the Clean Air Act (Act) as

amended November 15, 1990 (42 U.S.C. 7661). For more information about obtaining an operating permit see Chapter 6, Section 3.

(e) Definitions and Abbreviations: The following terms are explicitly defined for use in this section. As used in this section, all terms not defined herein shall have the meaning given to them in Chapter 1, Section 3.

(i) Definitions:

“Act” means the Clean Air Act (42 U.S.C. 7401 et seq.).

“Administrator” means the Administrator of the Division of Air Quality, Wyoming Department of Environmental Quality, except for those authorities which cannot be delegated to the state, in which case “administrator” means both the administrator of the Environmental Protection Agency and the Administrator of the Division of Air Quality, Wyoming Department of Environmental Quality.

“Affected facility” means, with reference to a stationary source, any apparatus to which a standard is applicable.

“Alternative method” means any method of sampling and analyzing for an air pollutant which is not a reference or equivalent method but which has been demonstrated to the Administrator’s satisfaction to, in some specific cases, produce results adequate for his determination of compliance.

“Capital expenditure” means an expenditure for a physical or operational change to an existing facility which exceeds the product of the applicable “annual asset guideline repair allowance percentage” specified in the latest edition of Internal Revenue Service (IRS) Publication 534 and the existing facility’s basis, as defined by section 1012 of the Internal Revenue Code. However, the total expenditure for a physical or operational change to an existing facility must not be reduced by any “excluded additions” as defined in IRS Publication 534, as would be done for tax purposes.

“Clean coal technology demonstration project” means a project using funds appropriated under the heading ‘Department of Energy-Clean Coal Technology’, up to a total amount of \$2,500,000,000 for commercial demonstrations of clean coal technology, or similar projects funded through appropriations for the Environmental Protection Agency.

“Commenced”, as applied to construction or modification of any new facility or source, means that the owner or operator has obtained a Construction Permit required by Chapter 6, Section 2 or either has (i) begun, or caused to begin, a continuous program of physical on-site construction or modification of the facility or (ii) entered into binding agreements or contractual obligations, which cannot be canceled or modified

without substantial loss to the owner or operator, to undertake a program of construction or modification of the facility to be completed within a reasonable time.

“Construction” means fabrication, erection, or installation of an affected facility.

“Continuous monitoring system” means the total equipment, required under the emission monitoring sections, used to sample and condition (if applicable), to analyze, and to provide a permanent record of emissions or process parameters.

“Electric utility steam generating unit” means any steam electric generating unit that is constructed for the purpose of supplying more than one-third of its potential electric output capacity and more than 25 MW electrical output to any utility power distribution system for sale. Any steam supplied to a steam distribution system for the purpose of providing steam to a steam-electric generator that would produce electrical energy for sale is also considered in determining the electrical energy output capacity of the affected facility.

“Equivalent method” means any method of sampling and analyzing for an air pollutant which has been demonstrated to the Administrator’s satisfaction to have a consistent and quantitatively known relationship to the reference method, under specified conditions.

“Excess emissions and monitoring systems performance report” is a report that must be submitted periodically by a source in order to provide data on its compliance with stated emission limits and operating parameters, and on the performance of its monitoring systems.

“Existing facility” means, with reference to a stationary source, any apparatus of the type for which a standard is promulgated in this section, and the construction or modification of which was commenced before the effective date of proposal of that standard; or any apparatus which could be altered in such a way as to be of that type.

“Isokinetic sampling” means sampling in which the linear velocity of the gas entering the sampling nozzle is equal to that of the undisturbed gas stream at the sample point.

“Issuance” of an operating permit will occur, in accordance with Chapter 6, Section 3.

“Malfunction” means any sudden, infrequent, and not reasonably preventable failure of air pollution control equipment, process equipment, or a process to operate in a normal or usual manner. Failures that are caused in part by poor maintenance or careless operation are not malfunctions.

“Monitoring device” means the total equipment, required under the monitoring of operations sections, used to measure and record (if applicable) process parameters.

“Nitrogen oxides” means all oxides of nitrogen except nitrous oxide, as measured by test methods set forth in this part.

“One-hour period” means any 60-minute period commencing on the hour.

“Opacity” means the degree to which emissions reduce the transmission of light and obscure the view of an object in the background.

“Operating permit” or “part 70 permit” means any permit or group of permits covering a source under Chapter 6, Section 3 that is issued, renewed, amended or revised pursuant to Chapter 6, Section 3.

“Owner or operator” means any person who owns, leases, operates, controls, or supervises an affected facility or a stationary source of which an affected facility is a part.

“Particulate matter” means any finely divided solid or liquid material, other than uncombined water, as measured by the reference methods specified under each subpart, or an equivalent or alternative method.

“Permit program” means the comprehensive State operating permit system established pursuant to Title V of the Act (42 U.S.C. 7661) and regulations in Chapter 6, Section 3.

“Proportional sampling” means sampling at a rate that produces a constant ratio of sampling rate to stack gas flow rate.

“Reactivation of a very clean coal-fired electric utility steam generating unit” means any physical change or change in the method of operation associated with the commencement of commercial operations by a coal-fired utility unit after a period of discontinued operation where the unit:

(A) Has not been in operation for the two-year period prior to the enactment of the Clean Air Act amendments of 1990, and the emissions from such unit continue to be carried in the permitting authority’s emissions inventory at the time of enactment;

(B) Was equipped prior to shut-down with a continuous system of emissions control that achieves a removal efficiency for sulfur dioxide of no less than 85 percent and a removal efficiency for particulates of no less than 98 percent;

(C) Is equipped with low-NO_x burners prior to the time of commencement of operations following reactivation; and

(D) Is otherwise in compliance with the requirements of the Clean Air Act.

“Reference method” means any method of sampling and analyzing for an air pollutant as specified in the applicable subpart.

“Repowering” means replacement of an existing coal-fired boiler with one of the following clean coal technologies: atmospheric or pressurized fluidized bed combustion, integrated gasification combined cycle, magnetohydrodynamics, direct and indirect coal-fired turbines, integrated gasification fuel cells, or as determined by the Administrator of EPA, in consultation with the Secretary of Energy, a derivative of one or more of these technologies, and any other technology capable of controlling multiple combustion emissions simultaneously with improved boiler or generation efficiency and with significantly greater waste reduction relative to the performance of technology in widespread commercial use as of November 15, 1990. Repowering shall also include any oil and/or gas-fired unit which has been awarded clean coal technology demonstration funding as of January 1, 1991, by the Department of Energy.

“Run” means the net period of time during which an emission sample is collected. Unless otherwise specified, a run may be either intermittent or continuous within the limits of good engineering practice.

“Shutdown” means the cessation of operation of an affected facility for any purpose.

“Six-minute period” means any one of the 10 equal parts of a one-hour period.

“Standard” means a standard of performance proposed or promulgated under this part.

“Standard conditions” means a temperature of 293°K (68°F) and a pressure of 101.3 Kilopascals of Hg (29.92 in. of Hg).

“Start-up” means the setting in operation of an affected facility for any purpose.

“State” means the Wyoming Air Quality Division which has been delegated authority to implement:

(A) The provisions of this section; and/or

(B) The permit program established under 40 CFR part 70.

“Stationary source” means any building, structure, facility, or installation which emits or may emit any air pollutant.

“Volatile organic compounds” means any organic compound which participates in atmospheric photochemical reactions; or which is measured by a reference method, an equivalent method, an alternative method, or which is determined by procedures specified under any subpart.

W	watt

(f) Permit Requirements: Compliance with the provisions of this section shall in no way relieve the owner or operator of responsibility for compliance with other applicable sections of these regulations. The permit requirements of Chapter 6, Section 2 are specifically applicable to affected facilities subject to the requirements of this section.

(g) Notification and Recordkeeping:

(i) Any owner or operator subject to the provisions of this section shall furnish the Administrator written notification as follows:

(A) A notification of the date construction (or reconstruction as defined under Chapter 1, Section 3) of an affected facility is commenced postmarked no later than 30 days after such date. This requirement shall not apply in the case of mass-produced facilities which are purchased in completed form.

(B) A notification of any physical or operational change to an existing facility which may increase the emission rate of any air pollutant to which a standard applies, unless that change is specifically exempted under an applicable subpart or in Chapter 5, Section 2(k). This notice shall be postmarked 60 days or as soon as practicable before the change is commenced and shall include information describing the precise nature of the change, present and proposed emission control systems, productive capacity of the facility before and after the change, and the expected completion date of the change. The Administrator may request additional relevant information subsequent to this notice.

(C) A notification of the date upon which demonstration of the continuous monitoring system performance commences in accordance with Chapter 5, Section 2(j)(iii). Notification shall be postmarked not less than 30 days prior to such date.

(D) A notification of the anticipated date for conducting the opacity observations required by Chapter 5, Section 2(i)(v) of this part. The notification shall be postmarked not less than 30 days prior to such date.

(E) A notification that continuous opacity monitoring system data results will be used to determine compliance with the applicable opacity standard during a performance test required by Chapter 5, Section 2(h) in lieu of Method 9 observation data as allowed by Chapter 5, Section 2(i)(v)(D). This notification shall be postmarked not less than 30 days prior to the date of the performance test.

(ii) Any owner or operator subject to the provisions of this part shall maintain records of the occurrence and duration of any start-up, shutdown, or malfunction in the operation of an affected facility; any malfunction of the air pollution control equipment; or any periods during which a continuous monitoring system or monitoring device is inoperative.

(iii) Each owner or operator required to install a continuous monitoring system (CMS) or monitoring device shall submit an excess emissions and monitoring systems performance report (excess emissions are defined in applicable subparts) and/or a summary report form (see paragraph E of this section) to the Administrator semiannually, except when: more frequent reporting is specifically required by an applicable subpart; or the CMS data are to be used directly for compliance determination, in which case quarterly reports shall be submitted; or the Administrator, on a case-by-case basis, determines that more frequent reporting is necessary to accurately assess the compliance status of the source. All reports shall be postmarked by the 30th day following the end of each calendar half (or quarter, as appropriate). Written reports of excess emissions shall include the following information:

(A) The magnitude of excess emissions computed in accordance with Chapter 5, Section 2(j)(viii), any conversion factor(s) used, and the date and time of

commencement and completion of each time period of excess emissions. The process operating time during the reporting period.

(B) Specific identification of each period of excess emissions that occurs during start-ups, shutdowns, malfunctions of the affected facility. The nature and cause of any malfunction (if known), the corrective action taken or preventative measures adopted.

(C) The date and time identifying each period during which the continuous monitoring system was inoperative except for zero and span checks and the nature of the system repairs or adjustments.

(D) When no excess emissions have occurred or the continuous monitoring system(s) have not been inoperative, repaired, or adjusted, such information shall be stated in the report.

(E) The summary report form shall contain the information and be in the format shown in Form B unless otherwise specified by the Administrator. One summary report form shall be submitted for each pollutant monitored at each affected facility.

(I) If the total duration of excess emissions for the reporting period is less than 1 percent of the total operating time for the reporting period and CMS downtime for the reporting period is less than 5 percent of the total operating time for the reporting period, only the summary report form shall be submitted and the excess emission report described in paragraph (iii) of this subsection need not be submitted unless requested by the Administrator.

(II) If the total duration of excess emissions for the reporting period is 1 percent or greater of the total operating time for the reporting period or the total CMS downtime for the reporting period is 5 percent or greater of the total operating time for the reporting period, the summary report form and the excess emission report described in paragraph (iii) of this subsection shall both be submitted.

Form B
EXCESS EMISSION SUMMARY REPORT

Emission Data Summary		CMS Performance Summary	
I. Duration of Excess Emissions in Reporting Period Due to:		I. CMS Downtime in Reporting Period Due to:	
A. Startup/Shutdown	_____	A. Monitor Equipment Malfunctions	_____
B. Control Equipment Problems	_____	B. Non-Monitor Equipment Malfunctions	_____
C. Process Problems	_____	C. Quality Assurance Calibration	_____
D. Other Known Causes	_____	D. Other Known Causes	_____
E. Unknown Causes	_____	E. Unknown Causes	_____
II. Total Duration of Excess Emission	_____	II. Total CMS Downtime	_____
III. Total Duration of Excess Emissions x 100 divided by Total Source Operating Time minus Total CMS Downtime	_____	III. Total CMS Downtime x 100 divided by Total Source Operating Time	_____

Total time of excess emission events due to emergency/abnormal operations _____.

NOTE:

1. Only report excess emissions which occur when the unit/process is operating. Include all excess emissions in the Emission Data Summary including those excess emissions associated with startup/shutdown and those excess emissions associated with Chapter 1, Section 5 (Emergency/Abnormal) operations. **Report times in hours for gaseous monitors and in tenths of an hour for opacity monitors.** Include detailed excess emission information and causes in the Excess Emission Table (Form C).
2. Only report CEM downtime which occurs while the unit/process is operating. **Report time in hours to one decimal point.** Include detailed CEM downtime and causes in the Monitor Outage Table (Form D).
3. Include an explanation of what corrective actions were taken for total excess emissions or monitor downtime for the quarter (Emission Data Summary and CMS Performance Summary, Item III) greater than 5%. **(See Instructions for further details.)**

On a separate page, describe any changes since last quarter in CMS, process or controls. I certify that the information contained in this report is true, accurate, and complete.

Name _____

Signature _____

Title _____

Date _____

(iv) (A) Notwithstanding the frequency of reporting requirements specified in paragraph (iii) of this subsection, an owner or operator who is required by an applicable subpart to submit excess emissions and monitoring systems performance reports (and summary reports) on a quarterly (or more frequent) basis may reduce the frequency of reporting for that standard to semiannual if the following conditions are met:

(I) For 1 full year (e.g., 4 quarterly or 12 monthly reporting periods) the affected facility's excess emissions and monitoring systems reports submitted to comply with a standard under this section continually demonstrate that the facility is in compliance with the applicable standard;

(II) The owner or operator continues to comply with all recordkeeping and monitoring requirements specified in this section and the applicable standard; and

(III) The Administrator does not object to a reduced frequency of reporting for the affected facility, as provided in paragraph (iv)(B) of this subsection.

(B) The frequency of reporting of excess emissions and monitoring systems performance (and summary) reports may be reduced only after the owner or operator notifies the Administrator in writing of the intent to make such a change and the Administrator does not object to the intended change. In deciding whether to approve a reduced frequency of reporting, the Administrator may review information concerning the source's entire previous performance history during the required recordkeeping period prior to the intended change, including performance test results, monitoring data, and evaluations of an owner or operator's conformance with operation and maintenance requirements. Such information may be used by the Administrator to make a judgment about the source's potential for noncompliance in the future. If the Administrator disapproves the owner or operator's request to reduce the frequency of reporting, the Administrator will notify the owner or operator in writing within 45 days after receiving notice of the owner or operator's intention. The notification from the Administrator to the owner or operator will specify the ground on which the disapproval is based. In the absence of a notice of disapproval within 45 days, approval is automatically granted.

(C) As soon as monitoring data indicate that the affected facility is not in compliance with any emission limitation or operating parameter specified in the applicable standard, the frequency of reporting shall revert to the frequency specified in the applicable standard, and the owner or operator shall submit an excess emissions and monitoring systems performance report (and summary report, if required) at the next appropriate reporting period following the noncomplying event. After demonstrating compliance with the applicable standard for another full year, the owner or operator may again request approval from the Administrator to reduce the frequency of reporting for that standard as provided for in paragraphs (iv)(A) and (iv)(B) of this subsection.

(v) Any owner or operator subject to the provisions of this part shall maintain a file of all measurements, including continuous monitoring system, monitoring device, and performance testing measurements; all continuous monitoring system performance evaluations; all continuous monitoring system or monitoring device calibration checks; adjustments and maintenance performed on these systems or devices; and all other information required by this part recorded in a permanent form suitable for inspection. The file shall be retained for at least two years following the date of such measurements, maintenance, reports, and record.

(vi) Individual subparts of 40 CFR part 60 may include specific provisions which clarify or made inapplicable the provisions set forth in this section.

(h) Performance Tests:

(i) The owner or operator of an affected facility shall conduct performance test(s) within the times specified in Chapter 6, Section 2(j) and furnish the Administrator a written report of the results of such performance test(s).

(ii) Performance tests shall be conducted and data reduced in accordance with the test methods and procedures contained in each applicable subpart unless the Administrator (1) specifies or approves, in specific cases, the use of a reference method with minor changes in methodology; (2) obtains approval from the EPA Administrator for use of an equivalent method; (3) obtains approval from the EPA Administrator for use of an alternative method the results of which he had determined to be adequate for indicating whether a specific source is in compliance; (4) waives the requirement for performance tests because the owner or operator of a source has demonstrated by other means to the Administrator's satisfaction that the affected facility is in compliance with the standard; or (5) approves shorter sampling times and smaller sample volumes when necessitated by process variables or other factors. Nothing in this paragraph shall be construed to abrogate the Administrator's authority to require other testing.

(iii) Performance tests shall be conducted under such conditions as the Administrator shall specify to the plant operator based on representative performance of the affected facility. The owner or operator shall make available to the Administrator such records as may be necessary to determine the conditions of the performance tests. Operations during periods of start-up, shutdown, and malfunction shall not constitute representative conditions for the purpose of a performance test nor shall emissions in excess of the level of the applicable emission limit during periods of start-up, shutdown, and malfunction be considered a violation of the applicable emission limit unless otherwise specified in the applicable standard.

(iv) The owner or operator of an affected facility shall provide, or cause to be provided, performance testing facilities as follows:

(A) Sampling ports adequate for test methods applicable to such facility. This includes:

(I) Constructing the air pollution control system such that volumetric flow rates and pollutant emission rates can be accurately determined by applicable test methods and procedures and;

(II) Providing a stack or duct free of cyclonic flow during performance tests, as demonstrated by applicable test methods and procedures;

(B) Safe sampling platform(s);

(C) Safe access to sampling platform(s);

(D) Utilities for sampling and testing equipment.

(v) Unless otherwise specified in the applicable subpart, each performance test shall consist of three separate runs using the applicable test method. Each run shall be conducted for the time and under the conditions specified in the applicable standard. For the purpose of determining compliance with an applicable standard, the arithmetic means of results of the three runs shall apply. In the event that a sample is accidentally lost or conditions occur in which one of the three runs must be discontinued because of forced shutdown, failure of an irreplaceable portion of the sample train, extreme meteorological conditions, or other circumstances, beyond the owner or operator's control, compliance may, upon the Administrator's approval, be determined using the arithmetic mean of the results of the two other runs.

(i) Compliance With Standards and Maintenance Requirements:

(i) Compliance with standards in this part, other than opacity standards, shall be determined by performance tests established by Chapter 5, Section 2(h), unless otherwise specified in the applicable standard.

(ii) Compliance with opacity standards in this part shall be determined by conducting observations in accordance with Reference Method 9 in 40 CFR part 60, Appendix A or any alternative method that is approved by the EPA Administrator, or as provided in paragraph (v)(D) of this section. For purposes of determining initial compliance, the minimum total time of observations shall be 3 hours (30 6-minute averages) for the performance test or other set of observations (meaning those fugitive-type emission sources subject only to an opacity standard).

(iii) The opacity standards set forth in this part shall apply at all times except during periods of start-up, shutdown, malfunction, and as otherwise provided in the applicable standard.

(iv) At all times, including periods of start-up, shutdown, and malfunction, owners and operators shall, to the extent practicable, maintain and operate any affected facility including associated air pollution control equipment in a manner consistent with good air pollution control practice for minimizing emissions. Determination of whether acceptable operating and maintenance procedures are being used will be based on information available to the Administrator which may include, but is not limited to, monitoring results, opacity observations, review of operating and maintenance procedures, and inspection of the source.

(v) (A) For the purpose of demonstrating initial compliance, opacity observations shall be conducted concurrently with the initial performance test required in Chapter 5, Section 2(h) unless one of the following conditions apply. If no performance test under Chapter 5, Section 2(h) is required, then opacity observations shall be conducted within 60 days after achieving the maximum production rate at which the affected facility will be operated but no later than 180 days after initial start-up of the facility. If visibility or other conditions prevent the opacity observations from being conducted concurrently with the initial performance test required under Chapter 5, Section 2(h), the source owner or operator shall reschedule the opacity observations as soon after the initial performance test as possible, but not later than 30 days thereafter, and shall advise the Administrator of the rescheduled date. In these cases, the 30-day prior notification to the Administrator required in Chapter 5, Section 2(g)(i)(D) shall be waived. The rescheduled opacity observations shall be conducted (to the extent possible) under the same operating conditions that existed during the initial performance test conducted under Chapter 5, Section 2(h). The visible emissions observer shall determine whether visibility or other conditions prevent the opacity observations from being made concurrently with the initial performance test in accordance with procedures contained in Reference Method 9 of 40 CFR part 60, Appendix A. Opacity reading of portions of plumes which contain condensed, uncombined water vapor shall not be used for purposes of determining compliance with opacity standards. The owner or operator of an affected facility shall make available, upon request by the Administrator, any records as may be necessary to determine the conditions under which the visual observations were made and shall provide evidence indicating proof of current visible observer emission certification. Except as provided in paragraph (v)(D) of this section, the results of continuous monitoring by transmissometer which indicate that the opacity at the time visual observations were made was not in excess of the standard are probative but not conclusive evidence of the actual opacity of an emission, provided that the source shall meet the burden of proving that the instrument used meets (at the time of the alleged violation) Performance Specification 1 in 40 CFR part 60, Appendix B, has been properly maintained and (at the time of the alleged violation) that the resulting data have not been altered in any way.

(I) The inability of an owner or operator to secure a visible emissions observer shall not be considered a reason for not conducting the opacity observations concurrent with the initial performance test.

(B) The owner or operator of an affected facility to which an opacity standard in this part applies shall conduct opacity observations in accordance with Chapter 5, Section 2(i)(ii), shall record the opacity of emissions, and shall report to the Administrator the opacity results along with the results of the initial performance test required under Chapter 5, Section 2(h).

(C) An owner or operator of an affected facility using a continuous opacity monitor (transmissometer) shall record the monitoring data produce during the initial performance test required by Chapter 5, Section 2(h) and furnish the Administrator a written report of the monitoring results along with Method 9 and Chapter 5, Section 2(h) performance test results.

(D) An owner or operator of an affected facility subject to an opacity standard may submit, for compliance purposes, continuous opacity monitoring system (COMS) data results produced during any performance test required under Chapter 5, Section 2(h) in lieu of Method 9 observation data. If an owner or operator elects to submit COMS data for compliance with the opacity standard, he shall notify the Administrator of that decision in writing, at least 30 days before any performance test required under Chapter 5, Section 2(h) is conducted. Once the owner or operator of an affected facility has notified the Administrator to that Effect, the COMS data results will be used to determine opacity compliance during subsequent tests required under Chapter 5, Section 2(h) until the owner or operator notifies the Administrator in writing to the contrary. For the purpose of determining compliance with the opacity standard during a performance test required under Chapter 5, Section 2(h) using COMS data the minimum total time of COMS data collection shall be averages of all 6-minute continuous periods within the duration of the mass emission performance test. Results of the COMS opacity determinations shall be submitted along with the results of the performance test required under Chapter 5, Section 2(h). The owner or operator of an affected facility using a COMS for compliance purposes is responsible for demonstrating that the COMS meets the requirements specified in Chapter 5, Section 2(j)(iii) of this part, that the COMS has been properly maintained and operated, and that the resulting data have not been altered in any way. If COMS data results are submitted for compliance with the opacity standard for a period of time during which Method 9 data indicates noncompliance, the Method 9 data will be used to determine opacity compliance.

(E) Upon receipt from an owner or operator of the written reports of the results of the performance tests required by Chapter 5, Section 2(h), the opacity observation results and observer certification required by Chapter 5, Section 2(i)(v)(A) and the COMS results, if applicable, the Administrator will make a finding concerning compliance with opacity and other applicable standards. If COMS data results are used to comply with an opacity standard, only those results are required to be submitted along with the performance test results required by Chapter 5, Section 2(h). If the Administrator finds that an affected facility is in compliance with all applicable standards for which performance tests are conducted in accordance with Chapter 5, Section 2(h) of this part but during the time such performance tests are being conducted fails to meet any

applicable opacity standard, he shall notify the owner or operator and advise him that he may petition the Administrator within 10 days of receipt of notification to make appropriate adjustment to the opacity standard for the affected facility. The notifications received requesting adjustments to the opacity standard of the affected facility will be forwarded to EPA for resolution.

(vi) Special provisions set forth under an applicable subpart in 40 CFR part 60 shall supersede any conflicting provisions in this section.

(vii) For the purpose of submitting compliance certifications or establishing whether or not a person has violated or is in violation of any standard in this section, nothing in this section shall preclude the use, including the exclusive use, of any credible evidence or information, relevant to whether a source would have been in compliance with the applicable requirements if the appropriate performance or compliance test or procedure had been performed.

(j) Monitoring Requirements:

(i) For the purposes of this section, all continuous monitoring systems required under applicable subparts shall be subject to the provisions of this section upon promulgation of performance specifications for continuous monitoring systems under 40 CFR part 60, Appendix B and, if the continuous monitoring system is used to demonstrate compliance with emission limits on a continuous basis, 40 CFR part 60, Appendix F, unless otherwise specified in an applicable subpart or by the Administrator. Appendix F is applicable December 4, 1987.

(ii) All continuous monitoring systems and monitoring devices shall be installed and operational prior to conducting performance tests under Chapter 5, Section 2(h). Verification of operational status shall, as a minimum, include completion of manufacturer's written requirements or recommendations for installation, operation, and calibration of the device.

(iii) If the owner or operator of an affected facility elects to submit continuous opacity monitoring system (COMS) data for compliance with the opacity standard as provided under Chapter 5, Section 2(i)(v)(D), he shall conduct a performance evaluation of the COMS as specified in Performance Specification 1, 40 CFR part 60, Appendix B, before the performance test required under Chapter 5, Section 2(h) is conducted. Otherwise, the owner or operator of an affected facility shall conduct a performance evaluation of the COMS or continuous emission monitoring system (CEMS) during any performance test required under Chapter 5, Section 2(h) or within 30 days thereafter in accordance with the applicable performance specification in 40 CFR part 60, Appendix B. The owner or operator of an affected facility shall conduct COMS or CEMS performance evaluations at such other times as may be required by the Administrator.

(A) The owner or operator of an affected facility using a COMS to determine opacity compliance during any performance test required under Chapter 5, Section 2(h) and as described in Chapter 5, Section 2(i)(v)(D) shall furnish the Administrator two or, upon request, more copies of a written report of the results of the COMS performance evaluation described in paragraph (iii) of this section at least 10 days before the performance test required under Chapter 5, Section 2(h) is conducted.

(B) Except as provided in paragraph (iii)(A) of this section, the owner or operator of an affected facility shall furnish the Administrator within 60 days of completion two or, upon request, more copies of a written report of the results of the performance evaluation.

(C) These continuous monitoring system performance evaluations, except as provided in paragraph (x) of this section shall be conducted in accordance with the requirements and procedures contained in the applicable performance specification of 40 CFR part 60, Appendix B as follows:

(I) Continuous monitoring systems for measuring opacity of emissions installed on or after March 30, 1983 shall comply with all the provisions and requirements in Performance Specification 1: continuous monitoring systems for measuring opacity of emissions installed before March 30, 1983 are required to comply with the provisions and requirements of Performance Specification 1 except for the following:

(1.) Section 4 - Installation specifications.

(2.) Paragraphs 5.1.4 - Optical alignment sight, 5.1.6 - Access to external optics, 5.1.7 - Automatic zero compensation indicator, and 5.1.8 - Slotted tube of Section 5 - Design and Performance Specification 1.

(3.) Paragraph 6.4 - Optical alignment sight of Section 6. Design specifications verification procedure.

If an existing opacity monitoring system is replaced on or after March 30, 1983, the new opacity monitoring system shall comply with the requirements of Performance Specification 1, except the new monitoring system may be located at the same measurement location as for the replaced monitoring system. If a new measurement location is to be determined at the time of replacement, the new location must meet the requirements of Performance Specification 1.

(II) Continuous monitoring systems for measuring nitrogen oxides emissions shall comply with Performance Specification 2.

(III) Continuous monitoring systems for measuring sulfur dioxide emissions shall comply with Performance Specification 2.

(IV) Continuous monitoring systems for measuring the oxygen content or carbon dioxide content of effluent gases shall comply with Performance Specification 3.

(iv) (A) Owners and operators of all continuous emission monitoring systems installed in accordance with the provisions of this part shall check the zero (or low-level value between 0 and 20 percent of span value) and span (50 to 100 percent of span value) calibration drifts at least once daily in accordance with a written procedure. The zero and span shall, as a minimum, be adjusted whenever the 24-hour zero drift or 24-hour span drift exceeds two times the limits of the applicable performance specifications in 40 CFR part 60, Appendix B. The system must allow the amount of excess zero and span drift measured at the 24-hour interval checks to be recorded and quantified, whenever specified. For continuous monitoring systems measuring opacity of emissions, the optical surfaces exposed to the effluent gases shall be cleaned prior to performing the zero and span drift adjustments except that for systems using automatic zero adjustments, the optical surfaces shall be cleaned when the cumulative zero compensation exceeds 4 percent opacity.

(B) Unless otherwise approved by the Administrator, the following procedures shall be followed for continuous monitoring systems measuring opacity of emissions. Minimum procedures shall include a method for producing a simulated zero opacity condition and an upscale (span value) opacity condition using a certified neutral density filter or other related technique to produce a known obscuration of the light beam. Such procedures shall provide a system check of the analyzer internal optical surfaces and all electronic circuitry including the lamp and photodetector assembly.

(v) Except for system breakdown, repairs, calibration checks, and zero and span adjustments required under paragraph (iv) of this section, all continuous monitoring systems shall be in continuous operation and shall meet minimum frequency of operation requirements as follows:

(A) All continuous monitoring systems referenced by paragraphs (iii)(A) and (B) of this section for measuring opacity of emissions shall complete a minimum of one cycle of sampling and analyzing for each successive ten-second period and one cycle of data recording for each successive six-minute period.

(B) All continuous monitoring systems referenced by paragraphs (iii)(A) and (B) of this section for measuring emissions, except opacity shall complete a minimum of one cycle of operation (sampling, analyzing, and data recording) for each successive 15-minute period.

(vi) All continuous monitoring systems or monitoring devices shall be installed such that representative measurements of emissions or process parameters from the affected facility are obtained. Additional procedures for location of continuous

monitoring systems contained in the applicable Performance Specifications of 40 CFR part 60, Appendix B of this section shall be used.

(vii) When the effluents from a single affected facility or two or more affected facilities subject to the same emission standards are combined before being released to the atmosphere, the owner or operator may install applicable continuous monitoring systems on each effluent or on the combined effluent. When the affected facilities are not subject to the same emissions standards, separate continuous monitoring systems shall be installed on each effluent. When the effluent from one affected facility is released to the atmosphere through more than one point, the owner or operator shall install applicable continuous monitoring systems on each separate effluent unless the installation of fewer systems is approved by the Administrator. When more than one continuous monitoring system is used to measure the emissions from one affected facility (e.g., multiple breechings, multiple outlets), the owner or operator shall report the results as required from each continuous monitoring system.

(viii) Owners or operators of all continuous monitoring systems for measurement of opacity shall reduce all data to six-minute averages and for systems other than opacity to one-hour averages for time period defined under Chapter 5, Section 2(c)(i). Six-minute opacity averages shall be calculated from 36 or more data points equally spaced over each six-minute period. For systems other than opacity, one-hour averages shall be computed from four or more data points equally spaced over each one-hour period. Data recorded during periods of system breakdowns, repairs, calibration checks, and zero and span adjustments shall not be included in the data averages computed under this paragraph. An arithmetic or integrated average of all data may be used. The data output of all continuous monitoring systems may be recorded in reduced or non-reduced form (e.g., ppm pollutant and percent O₂ or lb/million Btu of pollutant). All excess emissions shall be converted into units of the standard using the applicable conversion procedures specified in subparts. After conversion into units of the standard, the data may be rounded to the same number of significant digits used in subparts to specify the applicable standard (e.g., rounded to the nearest one percent opacity).

(ix) Upon written application by an owner or operator, the Administrator may approve alternatives to any monitoring procedures or requirements of this part including, but not limited to the following:

(A) Alternative monitoring requirements when installation of a continuous monitoring system or monitoring device specified by this part would not provide accurate measurements due to liquid water or other interferences caused by substances with the effluent gases.

(B) Alternative monitoring requirements when the affected facility is infrequently operated.

(C) Alternative monitoring requirement to accommodate continuous monitoring systems that require additional measurements to correct for stack moisture conditions.

(D) Alternative locations for installing continuous monitoring systems or monitoring devices when the owner or operator can demonstrate that installation at alternate locations will enable accurate and representative measurements.

(E) Alternative methods of converting pollutant concentration measurements to units of the standards.

(F) Alternative procedures for performing daily checks of zero and span drift that do not involve use of span gases or test cells.

(G) Alternatives to the A.S.T.M. test methods or sampling procedures specified by any subpart.

(H) Alternative continuous monitoring systems that do not meet the design or performance requirements in Performance Specification 1 of 40 CFR part 60, Appendix B, but adequately demonstrate a definite and consistent relationship between its measurements and the measurements of opacity by a system complying with the requirements in Performance Specification 1. The Administrator may require that such demonstration be performed for each affected facility.

(I) Alternative monitoring requirements when the effluent from a single affected facility or the combined effluent from two or more affected facilities are released to the atmosphere through more than one point.

(x) An alternative to the relative accuracy test specified in Performance Specification 2 of 40 CFR part 60, Appendix B may be requested as follows:

(A) An alternative to the reference method tests for determining relative accuracy is available for sources with emission rates demonstrated to be less than 50 percent of the applicable standard. A source owner or operator may petition the Administrator to waive the relative accuracy test in Section 7 of Performance Specification 2 and substitute the procedures in Section 10 if the results of the performance test conducted according to the requirements in Chapter 5, Section 2(h) of this subpart or other tests performed following the criteria in Chapter 5, Section 2(h) demonstrate that the emission rate of the pollutant of interest in the units of the applicable standard is less than 50 percent of the applicable standard. For sources subject to standards expressed as control efficiency levels, a source owner or operator may petition the Administrator to waive the relative accuracy test and substitute the procedures in Section 10 of Performance Specification 2 if the control device exhaust emission rate is less than 50 percent of the level needed to meet the control efficiency requirement. The alternative procedures do not apply if the continuous emission monitoring system is used

to determine compliance continuously with the applicable standard. The petition to waive the relative accuracy test shall include a detailed description of the procedures to be applied. Included shall be location and procedure for conducting the alternative, the concentration or response levels of the alternative RA materials, and the other equipment checks included in the alternative procedure. The Administrator will review the petition for completeness and applicability. The determination to grant a waiver will depend on the intended use of the CEMS data (e.g., data collection purposes other than NSPS) and may require specifications more stringent than in Performance Specification 2 (e.g., the applicable emission limit is more stringent than NSPS).

(B) The waiver of CEMS relative accuracy test will be reviewed and may be rescinded at such time following successful completion of the alternative RA procedure that the CEMS data indicate the source emissions approaching the level of the applicable standard. The criterion for reviewing the waiver is the collection of CEMS data showing that emissions have exceeded 70 percent of the applicable standard for seven consecutive averaging periods as specified by the applicable regulation(s). For sources subject to standards expressed as control efficiency levels, the criterion for reviewing the waiver is the collection of CEMS data showing that exhaust emissions have exceeded 70 percent of the level needed to meet the control efficiency requirement for seven consecutive averaging periods as specified by the applicable regulation(s). It is the responsibility of the source operator to maintain records and determine the level of emissions relative to the criterion on the waiver of relative accuracy testing. If this criterion is exceeded, the owner or operator must notify the Administrator within 10 days of such occurrence and include a description of the nature and cause of increasing emissions. The Administrator will review the notification and may rescind the waiver and require the owner or operator to conduct a relative accuracy test of the CEMS as specified in Section 7 of Performance Specification 2.

(k) Modification:

(i) Except as provided under paragraphs (iv) and (v) of this section, any physical or operational change to an existing facility which results in an increase in the emission rate to the atmosphere of any pollutant to which a standard applies shall be considered a modification. Upon modification, an existing facility shall become an affected facility for each pollutant to which a standard applies and for which there is an increase in the emission rate to the atmosphere.

(ii) Emission rate shall be expressed as kg/hr of any pollutant discharged into the atmosphere for which a standard is applicable. The Administrator shall use the following to determine emission rate:

(A) Emission factors as specified in the latest issue of "Compilation of Air Pollutant Emission Factors", EPA Publication No. AP-42, or other emission factors determined by the Administrator to be superior to AP-42 emission factors, in cases where utilization of emission factors demonstrate that the emission level

resulting from the physical or operational change will either clearly increase or clearly not increase.

(B) Material balances, continuous monitor data, or manual emission tests in cases where utilization of emission factors as referenced in paragraph (ii)(A) of this section does not demonstrate to the Administrator's satisfaction whether the emission level resulting from the physical or operational change will either clearly increase or clearly not increase, or where an owner or operator demonstrates to the Administrator's satisfaction that there are reasonable grounds to dispute the result obtained by the Administrator utilizing emission factors as referenced in paragraph (ii)(A) of this section. When the emission rate is based on results from manual emission tests or continuous monitoring systems, the procedures specified in 40 CFR part 60, Appendix C shall be used to determine whether an increase in emission rate has occurred. Tests shall be conducted under such conditions as the Administrator shall specify to the owner or operator based on representative performance of the facility. At least three valid test runs must be conducted before and at least three after the physical or operational change. All operating parameters which may affect emissions must be held constant to the maximum feasible degree for all test runs.

(iii) The addition of an affected facility to a stationary source as an expansion to that source or as a replacement for an existing facility shall not by itself bring within the applicability of this part any other facility within that source.

(iv) The following shall not, by themselves, be considered modifications under this part:

(A) Maintenance, repair, and replacement which the Administrator determines to be routine for a source category, subject to the provisions of paragraph (iii) of this section and Chapter 5, Section 2(I).

(B) An increase in production rate of an existing facility, if that increase can be accomplished without a capital expenditure on that facility.

(C) An increase in the hours of operation.

(D) Use of an alternative fuel or raw material if, prior to the date any standard under this part becomes applicable to that source type, as provided by Chapter 5, Section 2(d), the existing facility was designed to accommodate that alternative use. A facility shall be considered to be designed to accommodate an alternative fuel or raw material if that use could be accomplished under the facility's construction specifications, as amended, prior to the change. Conversion to coal required for energy considerations as specified in section 111(a)(8) of the Act, shall not be considered a modification.

(E) The addition or use of any system or device whose primary function is the reduction of air pollutants, except when an emission control system is removed or is replaced by a system which the Administrator determines to be less environmentally beneficial.

(F) The relocation or change in ownership of an existing facility.

(v) Special provisions set forth under an applicable subpart shall supersede any conflicting provisions of Chapter 5, Section 2(k).

(vi) Within 180 days of the completion of any physical or operational change subject to the control measures specified in paragraphs 2(k)(i) of this section, compliance with all applicable standards must be achieved.

(vii) No physical change, or change in the method of operation, at an existing electric utility steam generating unit shall be treated as a modification for the purposes of this subsection provided that such change does not increase the maximum hourly emissions of any pollutant regulated under this subsection above the maximum hourly emissions achievable at that unit during the 5 years prior to the change.

(viii) Repowering projects that are awarded funding from the Department of Energy as permanent clean coal technology demonstration projects (or similar projects funded by EPA) are exempt from the requirements of this section provided that such change does not increase the maximum hourly emissions of any pollutant regulated under this section above the maximum hourly emissions achievable at that unit during the five years prior to the change.

(ix) (A) Repowering projects that qualify for an extension under section 409(b) of the Clean Air Act are exempt from the requirements of this section, provided that such change does not increase the actual hourly emissions of any pollutant regulated under this section above the actual hourly emissions achievable at that unit during the 5 years prior to the change.

(B) This exemption shall not apply to any new unit that:

(I) Is designated as a replacement for an existing unit;

(II) Qualifies under section 409(b) of the Clean Air Act for an extension of an emission limitation compliance date under section 405 of the Clean Air Act; and

(III) Is located at a different site than the existing unit.

(x) The installation, operation, cessation, or removal of a temporary clean coal technology demonstration project is exempt from the requirements of this section. A

temporary clean coal control technology demonstration project, for the purposes of this section is a clean coal technology demonstration project that is operated for a period of 5 years or less, and which complies with the State implementation plan for the state in which the project is located and other requirements necessary to attain and maintain the National Ambient Air Quality Standards during the project and after it is terminated.

(xi) The reactivation of a very clean coal-fired electric utility steam generating unit is exempt from the requirements of this section.

(l) Reconstruction:

(i) An existing facility, upon reconstruction, becomes an affected facility, irrespective of any change in emission rate.

(ii) **“Reconstruction”** means the replacement of components of an existing facility to such an extent that:

(A) The fixed capital cost of the new components exceeds 50 percent of the fixed capital cost that would be required to construct a comparable entirely new facility, and

(B) It is technologically and economically feasible to meet the applicable standards set forth in this part.

(iii) **“Fixed capital cost”** means the capital needed to provide all the depreciable components.

(iv) If an owner or operator of an existing facility proposes to replace components, and the fixed capital cost of the new components exceeds 50 percent of the fixed capital cost that would be required to construct a comparable entirely new facility, he shall notify the Administrator of the proposed replacements. The notice must be postmarked 60 days (or as soon as practicable) before construction of the replacements is commenced and must include the following information:

(A) Name and address of the owner or operator.

(B) The location of the existing facility.

(C) A brief description of the existing facility and the components which are to be replaced.

(D) A description of the existing air pollution control equipment and the proposed air pollution control equipment.

(E) An estimate of the fixed capital cost of the replacements and of constructing a comparable entirely new facility.

(F) The estimated life of the existing facility after the replacements.

(G) A discussion of any economic or technical limitations the facility may have in complying with the applicable standards of performance after the proposed replacements.

(v) The Administrator will determine, within 30 days of the receipt of the notice required by paragraph (iv) of this section and any additional information he may reasonably require, whether the proposed replacement constitutes reconstruction.

(vi) The Administrator's determination under paragraph (v) shall be based on:

(A) The fixed capital cost of the replacements in comparison to the fixed capital cost that would be required to construct a comparable entirely new facility;

(B) The estimated life of the facility after the replacements compared to the life of a comparable entirely new facility;

(C) The extent to which the components being replaced cause or contribute to the emissions from the facility and

(D) Any economic or technical limitations on compliance with applicable standards of performance which are inherent in the proposed replacements.

(vii) Individual subparts may include specific provisions which refine and delimit the concept of reconstruction set forth in this section.

(m) General Control Device Requirements:

(i) This section contains requirements for control devices used to comply with applicable subparts of Chapter 5, Section 2. The requirements are placed here for administrative convenience and only apply to facilities covered by subparts referring to this section.

(ii) Flares:

(A) General Design:

(I) Flares shall be designed for and operated with no visible emissions as determined by the methods specified in paragraph (D), except for periods not to exceed a total of 5 minutes during any 2 consecutive hours.

(II) Flares shall be operated with flame present at all times, as determined by the methods specified in paragraph (D).

(III) Flares shall be used only with the net heating value of the gas being combusted being 300 Btu/Scf (11.2 MJ/scm) or greater if the flare is steam-assisted or air-assisted or with the net heating value of the gas being combusted being 200 Btu/scf (7.45 MJ/scm) or greater if the flare is nonassisted. The net heating value of the gas being combusted shall be determined by the methods specified in paragraph (D).

(IV) Steam-assisted and nonassisted flare shall be designed for and operated with an exit velocity as determined by the methods specified in paragraph (D)(IV), less than 60 ft/sec (18.3 m/sec) except as follows:

(1.) Steam-assisted and nonassisted flares designed for and operated with an exit velocity, as determined by the methods specified in paragraph (D)(IV) equal to or greater than 60 ft/sec (18.3 m/sec) but less than 400 ft/sec (122 m/sec) are allowed if the net heating value of the gas being combusted is greater than 1000 Btu/scf (37.3 MJ/scm).

(2.) Steam-assisted and nonassisted flares designed for and operated with an exit velocity as determined by the methods specified in paragraph (D)(IV), less than the velocity V_{max} , as determined by the method specified in paragraph (D)(V), and less than 400 ft/sec (122 m/sec) are allowed.

(V) Air-assisted flares shall be designed and operated with an exit velocity less than the velocity, V_{max} , as determined by the method specified in paragraph (D)(VI).

(VI) Flares used to comply with this section shall be steam-assisted, air-assisted or nonassisted.

(B) Owners or operators of flares used to comply with the provisions of this section shall monitor these control devices to ensure that they are operated and maintained in conformance with their designs. Applicable subparts will provide provisions stating how owners or operators of flares shall monitor these control devices.

(C) Flares used to comply with the provisions of an applicable subpart shall be operated at all times when emissions may be vented to them.

(D) Determinations:

(I) Reference Method 22 shall be used to determine the compliance of flares with the visible emission provisions of this section. The observation period is 2 hours and shall be used according to Method 22.

(II) The presence of a flare pilot flame shall be monitored using a thermocouple or any other equivalent device to detect the presence of a flame.

(III) The net heating value of the gas being combusted in a flare shall be calculated using the following equation:

$$H_T = K \sum_{i=1}^n C_i H_i$$

where:

H_T = Net heating value of the sample, MJ/scm; where the net enthalpy per mole of offgas is based on combustion at 25°C and 760 mm Hg, but the standard temperature for determining the value corresponding to one mole is 20°C.

K = Constant,

$$1.740 \times 10^{-7} \left(\frac{1}{ppm} \right) \left(\frac{gmole}{scm} \right) \left(\frac{MJ}{kcal} \right)$$

Where the standard temperature of $\left(\frac{gmole}{scm} \right)$ is 20°C

C_i = Concentration of sample component i in ppm on a wet basis, as measured for organics by reference method 18 and measured for hydrogen and carbon monoxide by ASTM D1946-90 (2006) Standard Practice for Analysis of Reformed Gas by Gas Chromatography.

H_i = Net heat of combustion of sample component i, kcal/g mole at 25°C and 760 mm Hg. The heats of combustion may be determined using ASTM D4809-00 (2005) Standard Test Method for Heat of Combustion of Liquid Hydrocarbon Fuels by Bomb Calorimeter (Precision Method) if published values are not available or cannot be calculated.

(IV) The actual exit velocity of a flare shall be determined by dividing the volumetric flowrate (in units of standard temperature and pressure), as determined by reference methods 2, 2A, 2C, or 2D as appropriate; by the unobstructed (free) cross sectional area of the flare tip.

(V) The maximum permitted velocity V_{\max} , for flares complying with paragraph (A)(IV)(2.) shall be determined by the following equation:

$$\text{Log}_{10}(V_{\max}) = \frac{H_T + 28.80}{31.7}$$

V_{\max} = Maximum permitted velocity, m/sec

28.8 = Constant

31.7 = Constant

H_T = The net heating value as determined in paragraph (D)(III)

(VI) The maximum permitted velocity, V_{\max} , for air-assisted flares shall be determined by the following equation:

$$V_{\max} = 8.706 + 0.7084(H_T)$$

V_{\max} = Maximum permitted velocity m/sec

8.706 = Constant

0.7084 = Constant

H_T = The net heating value as determined in paragraph (D)(III)

(n) General Notification and Reporting Requirements:

(i) For the purposes of this section, time periods specified in days shall be measured in calendar days, even if the word "calendar" is absent, unless otherwise specified in an applicable requirement.

(ii) For the purposes of this section, if an explicit postmark deadline is not specified in an applicable requirement for the submittal of a notification, application, report, or other written communication to the Administrator, the owner or operator shall postmark the submittal on or before the number of days specified in the applicable requirement. For example, if a notification must be submitted 15 days before a particular event is scheduled to take place, the notification shall be postmarked on or before 15 days preceding the event; likewise, if a notification must be submitted 15 days after a particular event takes place, the notification shall be delivered or postmarked on or before 15 days following the end of the event. The use of reliable non-government mail carriers that provide indications of verifiable delivery of information required to be submitted to the Administrator, similar to the postmark provided by the U.S. Postal Service, or alternative means of delivery agreed to by the permitting authority, is acceptable.

(iii) Notwithstanding time period or postmark deadlines specified in this section for the submittal of information to the Administrator by an owner or operator, or the review of such information by the Administrator, such time periods or deadlines may be changed by mutual agreement between the owner or operator and the Administrator.

Procedures governing the implementation of this provision are specified in paragraph (vi) of this subsection.

(iv) The owner or operator may change the dates by which periodic reports under this section shall be submitted (without changing the frequency of reporting) to be consistent with the schedule specified in Chapter 5, Section 2, by mutual agreement between the owner or operator and the Administrator. The allowance in the previous sentence applies in each state beginning 1 year after the affected facility is required to be in compliance with the applicable subpart in 40 CFR part 63. Procedures governing the implementation of this provision are specified in paragraph (vi) of this subsection.

(v) If an owner or operator supervises one or more stationary sources affected by standards set under this section and standards set under 40 CFR part 61, Chapter 5, Section 3 or both, may be arranged by mutual agreement between the owner or operator and the Administrator a common schedule on which periodic reports required by each applicable standard shall be submitted throughout the year. The allowance in the previous sentence applies in each state beginning 1 year after the stationary source is required to be in compliance with the applicable subpart in this section, or 1 year after the stationary source is required to be in compliance with the applicable 40 CFR part 61 or Chapter 5, Section 3, whichever is latest. Procedures governing the implementation of this provision are specified in paragraph (vi) of this subsection.

(vi) (A) (I) Until an adjustment of a time period or postmark deadline has been approved by the Administrator under paragraphs (vi)(B) and (vi)(C) of this subsection, the owner or operator of an affected facility remains strictly subject to the requirements of this section.

(II) An owner or operator shall request the adjustment provided for in paragraphs (vi)(B) and (vi)(C) of this subsection each time changes to an applicable time period or postmark deadline specified in this section are desired.

(B) Notwithstanding time periods or postmark deadlines specified in this section for the submittal of information to the Administrator by an owner or operator, or the review of such information by the Administrator, such time periods or deadlines may be changed by mutual agreement between the owner or operator and the Administrator. An owner or operator who wishes to request a change in a time period or postmark deadline for a particular requirement shall request the adjustment in writing as soon as practicable before the subject activity is required to take place. The owner or operator shall include in the request whatever information is considered useful to convince the Administrator that an adjustment is warranted.

(C) If, in the Administrator's judgment, an owner or operator's request for an adjustment to a particular time period or postmark deadline is warranted, the Administrator will approve the adjustment. The Administrator will notify the owner

or operator in writing of approval or disapproval of the request for an adjustment within 15 calendar days of receiving sufficient information to evaluate the request.

(D) If the Administrator is unable to meet a specified deadline, the owner or operator will be notified of any significant delay and inform the owner or operator of the amended schedule.

Section 3. National emission standards for hazardous air pollutants.

(a) General: The U.S. Environmental Protection Agency regulations on national emission standards for hazardous air pollutants (NESHAP), established pursuant to section 112 of the Act as amended November 15, 1990, and amended by the word or phrase “substitutions” given in Chapter 5, Section 3(c) are incorporated into these regulations. The specific documents containing the complete text of the regulations are found in 40 CFR part 63. The standards designated in Chapter 5, Section 3(b) regulate specific categories of stationary sources that emit (or have the potential to emit) one or more of the hazardous air pollutants listed pursuant to section 112(b) of the Act, and presented in subsection (d)(ii)(A)(I) of Chapter 5, Section 3.

(b) Designated National Emission Standards for Hazardous Air Pollutants: The following standards for hazardous air pollutants, as revised and published in 40 CFR part 63, are incorporated by reference under Section 4(a) of this Chapter.

40 CFR part 63, Subpart D -	Regulations Governing Compliance Extensions for Early Reductions of Hazardous Air Pollutants
40 CFR part 63, Subpart F -	National Emission Standards for Organic Hazardous Air Pollutants From the Synthetic Organic Chemical Manufacturing Industry
40 CFR part 63, Subpart G -	National Emission Standards for Organic Hazardous Air Pollutants From the Synthetic Organic Chemical Manufacturing Industry for Process Vents, Storage Vessels, Transfer Operations, and Wastewater
40 CFR part 63, Subpart H -	National Emission Standards for Organic Hazardous Air Pollutants for Equipment Leaks
40 CFR part 63, Subpart I -	National Emission Standards for Organic Hazardous Air Pollutants

	for Certain Processes Subject to the Negotiated Regulation for Equipment Leaks
40 CFR part 63, Subpart J -	National Emission Standards for Hazardous Air Pollutants for Polyvinyl Chloride and Copolymers Production
40 CFR part 63, Subpart L -	National Emission Standards for Coke Oven Batteries
40 CFR part 63, Subpart M -	National Perchloroethylene Air Emission Standards for Dry Cleaning Facilities
40 CFR part 63, Subpart N -	National Emission Standards for Chromium Emissions From Hard and Decorative Chromium Electroplating and Chromium Anodizing Tanks
40 CFR part 63, Subpart O -	Ethylene Oxide Emissions Standards for Sterilization Facilities
40 CFR part 63, Subpart Q -	National Emission Standards for Hazardous Air Pollutants for Industrial Process Cooling Towers
40 CFR part 63, Subpart R -	National Emission Standards for Gasoline Distribution Facilities (Bulk Gasoline Terminals and Pipeline Breakout Stations)
40 CFR part 63, Subpart S -	National Emission Standards for Hazardous Air Pollutants from the Pulp and Paper Industry
40 CFR part 63, Subpart T -	National Emission Standards for Halogenated Solvent Cleaning

40 CFR part 63, Subpart U -	National Emission Standards for Hazardous Air Pollutant Emissions: Group I Polymers and Resins
40 CFR part 63, Subpart W -	National Emission Standards for Hazardous Air Pollutants for Epoxy Resins Production and Non-Nylon Polyamides Production
40 CFR part 63, Subpart X -	National Emission Standards for Hazardous Air Pollutants from Secondary Lead Smelting
40 CFR part 63, Subpart Y -	National Emission Standards for Marine Tank Vessel Loading Operations
40 CFR part 63, Subpart AA -	National Emission Standards for Hazardous Air Pollutants From Phosphoric Acid Manufacturing Plants
40 CFR part 63, Subpart BB -	National Emission Standards for Hazardous Air Pollutants From Phosphate Fertilizers Production Plants
40 CFR part 63, Subpart CC -	National Emission Standards for Hazardous Air Pollutants From Petroleum Refineries
40 CFR part 63, Subpart DD -	National Emission Standards for Hazardous Air Pollutants from Off-Site Waste and Recovery Operations
40 CFR part 63, Subpart EE -	National Emission Standards for Magnetic Tape Manufacturing Operations
40 CFR part 63, Subpart GG -	National Emission Standards for Aerospace Manufacturing and Rework Facilities

40 CFR part 63, Subpart HH -	National Emission Standards for Hazardous Air Pollutants From Oil and Natural Gas Production Facilities
40 CFR part 63, Subpart II -	National Emission Standards for Shipbuilding and Ship Repair (Surface Coating)
40 CFR part 63, Subpart JJ -	National Emission Standards for Wood Furniture Manufacturing Operations
40 CFR part 63, Subpart KK -	National Emission Standards for the Printing and Publishing Industry
40 CFR part 63, Subpart LL -	National Emission Standards for Hazardous Air Pollutants for Primary Aluminum Reduction Plants
40 CFR part 63, Subpart MM -	National Emission Standards for Hazardous Air Pollutants for Chemical Recovery Combustion Sources at Kraft, Soda, Sulfite, and Stand-Alone Semichemical Pulp Mills
40 CFR part 63, Subpart OO -	National Emission Standards for Tanks - Level 1
40 CFR part 63, Subpart PP -	National Emission Standards for Containers
40 CFR part 63, Subpart QQ -	National Emission Standards for Surface Impoundments
40 CFR part 63, Subpart RR -	National Emission Standards for Individual Drain Systems
40 CFR part 63, Subpart SS -	National Emission Standards for Closed Vent Systems, Control Devices, Recovery Devices and Routing to a Fuel Gas System or a Process

40 CFR part 63, Subpart TT -	National Emission Standards for Equipment Leaks - Control Level 1
40 CFR part 63, Subpart UU -	National Emission Standards for Equipment Leaks - Control Level 2 Standards
40 CFR part 63, Subpart VV -	National Emission Standards for Oil-Water Separators and Organic-Water Separators
40 CFR part 63, Subpart WW -	National Emission Standards for Storage Vessels (Tanks) - Control Level 2
40 CFR part 63, Subpart XX -	National Emission Standards for Ethylene Manufacturing Process Units: Heat Exchange Systems and Waste Operations
40 CFR part 63, Subpart YY -	National Emission Standards for Hazardous Air Pollutants for Source Categories: Generic Maximum Achievable Control Technology Standards
40 CFR part 63, Subpart CCC -	National Emission Standards for Hazardous Air Pollutants for Steel Pickling - HCl Process Facilities and Hydrochloric Acid Regeneration Plants
40 CFR part 63, Subpart DDD -	National Emission Standards for Hazardous Air Pollutants for Mineral Wool Production
40 CFR part 63, Subpart EEE -	National Emission Standards for Hazardous Air Pollutants from Hazardous Waste Combustors
40 CFR part 63, Subpart GGG -	National Emission Standards for Pharmaceuticals Production

40 CFR part 63, Subpart HHH -	National Emission Standards for Hazardous Air Pollutants From Natural Gas Transmission and Storage Facilities
40 CFR part 63, Subpart III -	National Emission Standards for Hazardous Air Pollutants for Flexible Polyurethane Foam Production
40 CFR part 63, Subpart JJJ -	National Emission Standards for Hazardous Air Pollutant Emissions: Group IV Polymers and Resins
40 CFR part 63, Subpart LLL -	National Emission Standards for Hazardous Air Pollutants From the Portland Cement Manufacturing Industry
40 CFR part 63, Subpart MMM -	National Emission Standards for Hazardous Air Pollutants for Pesticide Active Ingredient Production
40 CFR part 63, Subpart NNN -	National Emission Standards for Hazardous Air Pollutants for Wool Fiberglass Manufacturing
40 CFR part 63, Subpart OOO -	National Emission Standards for Hazardous Air Pollutant Emissions: Manufacture of Amino/Phenolic Resins
40 CFR part 63, Subpart PPP -	National Emission Standards for Hazardous Air Pollutants for Polyether Polyols Production
40 CFR part 63, Subpart QQQ -	National Emission Standards for Hazardous Air Pollutants for Primary Copper Smelting
40 CFR part 63, Subpart RRR -	National Emission Standards for Hazardous Air Pollutants for Secondary Aluminum Production

40 CFR part 63, Subpart TTT -	National Emission Standards for Hazardous Air Pollutants for Primary Lead Smelting
40 CFR part 63, Subpart UUU -	National Emission Standards for Hazardous Air Pollutants for Petroleum Refineries: Catalytic Cracking Units, Catalytic Reforming Units, and Sulfur Recovery Units
40 CFR part 63, Subpart VVV -	National Emission Standards for Hazardous Air Pollutants: Publicly Owned Treatment Works
40 CFR part 63, Subpart XXX -	National Emission Standards for Hazardous Air Pollutants for Ferroalloys Production: Ferromanganese and Silicomanganese
40 CFR part 63, Subpart AAAA -	National Emission Standards for Hazardous Air Pollutants: Municipal Solid Waste Landfills
40 CFR part 63, Subpart CCCC -	National Emission Standards for Hazardous Air Pollutants: Manufacturing of Nutritional Yeast
40 CFR part 63, Subpart DDDD -	National Emission Standards for Hazardous Air Pollutants: Plywood and Composite Wood Products
40 CFR part 63, Subpart EEEE -	National Emission Standards for Hazardous Air Pollutants: Organic Liquids Distribution (Non-Gasoline)
40 CFR part 63, Subpart FFFF -	National Emission Standards for Hazardous Air Pollutants: Miscellaneous Organic Chemical Manufacturing
40 CFR part 63, Subpart GGGG -	National Emission Standards for Hazardous Air Pollutants: Solvent

	Extraction for Vegetable Oil Production
40 CFR part 63, Subpart HHHH -	National Emission Standards for Hazardous Air Pollutants for Wet-Formed Fiberglass Mat Production
40 CFR part 63, Subpart IIII -	National Emission Standards for Hazardous Air Pollutants: Surface Coating of Automobiles and Light-Duty Trucks
40 CFR part 63, Subpart JJJJ -	National Emission Standards for Hazardous Air Pollutants: Paper and Other Web Coating
40 CFR part 63, Subpart KKKK -	National Emission Standards for Hazardous Air Pollutants: Surface Coating of Metal Cans
40 CFR part 63, Subpart MMMM -	National Emission Standards for Hazardous Air Pollutants for Surface Coating of Miscellaneous Metal Parts and Products
40 CFR part 63, Subpart NNNN -	National Emission Standards for Hazardous Air Pollutants: Surface Coating of Large Appliances
40 CFR part 63, Subpart OOOO -	National Emission Standards for Hazardous Air Pollutants: Printing, Coating, and Dyeing of Fabrics and Other Textiles
40 CFR part 63, Subpart PPPP -	National Emission Standards for Hazardous Air Pollutants for Surface Coating of Plastic Parts and Products
40 CFR part 63, Subpart QQQQ -	National Emission Standards for Hazardous Air Pollutants: Surface Coating of Wood Building Products

40 CFR part 63, Subpart RRRR -	National Emission Standards for Hazardous Air Pollutants: Surface Coating of Metal Furniture
40 CFR part 63, Subpart SSSS -	National Emission Standards for Hazardous Air Pollutants: Surface Coating of Metal Coil
40 CFR part 63, Subpart TTTT -	National Emission Standards for Hazardous Air Pollutants for Leather Finishing Operations
40 CFR part 63, Subpart UUUU -	National Emission Standards for Hazardous Air Pollutants for Cellulose Products Manufacturing
40 CFR part 63, Subpart VVVV -	National Emission Standards for Hazardous Air Pollutants for Boat Manufacturing
40 CFR part 63, Subpart WWWW -	National Emissions Standards for Hazardous Air Pollutants: Reinforced Plastic Composites Production
40 CFR part 63, Subpart XXXX -	National Emission Standards for Hazardous Air Pollutants: Rubber Tire Manufacturing
40 CFR part 63, Subpart YYYY -	National Emission Standards for Hazardous Air Pollutants for Stationary Combustion Turbines
40 CFR part 63, Subpart ZZZZ -	National Emission Standards for Hazardous Air Pollutants for Stationary Reciprocating Internal Combustion Engines
40 CFR part 63, Subpart AAAAA -	National Emissions Standards for Hazardous Air Pollutants for Lime Manufacturing Plants
40 CFR part 63, Subpart BBBB -	National Emission Standards for Hazardous Air Pollutants for Semiconductor Manufacturing

40 CFR part 63, Subpart CCCCC -	National Emission Standards for Hazardous Air Pollutants for Coke Ovens: Pushing, Quenching, and Battery Stacks
40 CFR part 63, Subpart EEEEE -	National Emission Standards for Hazardous Air Pollutants for Iron and Steel Foundries
40 CFR part 63, Subpart FFFFF -	National Emission Standards for Hazardous Air Pollutants for Integrated Iron and Steel Manufacturing Facilities
40 CFR part 63, Subpart GGGGG -	National Emission Standards for Hazardous Air Pollutants: Site Remediation
40 CFR part 63, Subpart HHHHH -	National Emission Standards for Hazardous Air Pollutants: Miscellaneous Coating Manufacturing
40 CFR part 63, Subpart IIIII -	National Emission Standards for Hazardous Air Pollutants: Mercury Emissions From Mercury Cell Chlor-Alkali Plants
40 CFR part 63, Subpart JJJJJ -	National Emission Standards for Hazardous Air Pollutants for Brick and Structural Clay Products Manufacturing
40 CFR part 63, Subpart KKKKK -	National Emission Standards for Hazardous Air Pollutants for Clay Ceramics Manufacturing
40 CFR part 63, Subpart LLLLL -	National Emission Standards for Hazardous Air Pollutants: Asphalt Processing and Asphalt Roofing Manufacturing
40 CFR part 63, Subpart MMMMM -	National Emission Standards for Hazardous Air Pollutants: Flexible

	Polyurethane Foam Fabrication Operations
40 CFR part 63, Subpart NNNNN -	National Emission Standards for Hazardous Air Pollutants: Hydrochloric Acid Production
40 CFR part 63, Subpart PPPPP -	National Emission Standards for Hazardous Air Pollutants for Engine Test Cells/Standards
40 CFR part 63, Subpart QQQQQ -	National Emission Standards for Hazardous Air Pollutants for Friction Materials Manufacturing Facilities
40 CFR part 63, Subpart RRRRR -	National Emission Standards for Hazardous Air Pollutants: Taconite Iron Ore Processing
40 CFR part 63, Subpart SSSSS -	National Emission Standards for Hazardous Air Pollutants for Refractory Products Manufacturing
40 CFR part 63, Subpart TTTTT -	National Emissions Standards for Hazardous Air Pollutants for Primary Magnesium Refining
<u>40 CFR part 63, Subpart BBBBBB -</u>	<u>National Emission Standards for Hazardous Air Pollutants for Source Category: Gasoline Distribution Bulk Terminals, Bulk Plants, and Pipeline Facilities</u>

The following additional standards for hazardous air pollutants, not including later amendments, ~~are~~ is adopted by reference from the *Federal Register*, as published by the National Archives and Records Administration. *Federal Register* publishing dates, volumes and pages for ~~each~~ the standard ~~are~~ is noted below:

September 13, 2004 Vol. 69, P. 55218	40 CFR part 63 - Subpart DDDDD	National Emission Standards for Hazardous Air Pollutants for Industrial, Commercial, and Institutional Boilers and Process Heaters
---	-----------------------------------	--

(i) Designated Appendices: The following appendices are incorporated by reference under Section 4(a) of this Chapter.

40 CFR part 63, Appendix A - Test Methods

40 CFR part 63, Appendix B - Sources Defined For Early Reduction Provisions

40 CFR part 63, Appendix C - Determination of the Fraction Biodegraded (F_{bio}) in a Biological Treatment Unit

40 CFR part 63, Appendix D - Alternative Validation Procedure for EPA Waste and Wastewater Methods

40 CFR part 63, Appendix E - Monitoring Procedure for Nonthoroughly Mixed Open Biological Treatment Systems at Kraft Pulp Mills Under Unsafe Sampling Conditions

(c) Word or Phrase Substitutions: In the standards designated in Chapter 5, Section 3(b) substitute:

- (i) Chapter 5, Section 3 for Subpart A.
- (ii) Chapter 5, Section 3(d) for 63.1.
- (iii) Chapter 5, Section 3(e) for 63.2.
- (iv) Chapter 5, Section 3(f) for 63.3.
- (v) Chapter 5, Section 3(g) for 63.4.
- (vi) Chapter 6, Section 5 for 63.5.
- (vii) Chapter 5, Section 3(h) for 63.6.
- (viii) Chapter 5, Section 3(i) for 63.7.
- (ix) Chapter 5, Section 3(j) for 63.8.
- (x) Chapter 5, Section 3(k) for 63.9.
- (xi) Chapter 5, Section 3(l) for 63.10.
- (xii) Chapter 5, Section 3(m) for 63.11.
- (xiii) Chapter 5, Section 3(n) for 63.15.

(d) Applicability.

(i) General.

(A) Terms used throughout Chapter 5, Section 3 are defined in subsection (e) or in the Clean Air Act (Act) as amended in 1990, except that the individual subparts listed in subsection (b) and contained in 40 CFR part 63, may include specific definitions in addition to or that supersede definitions in subsection (e).

(B) No emission standard or other requirement established under this section shall be interpreted, construed, or applied to diminish or replace the

requirements of a more stringent emission limitation or other applicable requirement established by EPA or the Administrator including the requirements in Chapter 5, Section 2, New Source Performance Standards, or any standard defined in the WAQSR.

(C) The provisions of this section apply to owners or operators who are subject to subsequent subparts listed in Chapter 5, Section 3(b), except when otherwise specified in a particular subpart or in a relevant standard. The provisions of Chapter 5, Section 3 eliminate the repetition of requirements applicable to all owners or operators affected by this section. The provisions in Chapter 5, Section 3 do not apply to regulations developed pursuant to section 112(r) of the amended Act, unless otherwise specified in those regulations.

(D) Subpart D of 40 CFR part 63 contains regulations that address procedures for an owner or operator to obtain an extension of compliance with a relevant standard through an early reduction of emissions of hazardous air pollutants pursuant to section 112(i)(5) of the Act.

(E) For the purposes of this section, time periods specified in days shall be measured in calendar days, even if the word “calendar” is absent, unless otherwise specified in an applicable requirement.

(F) For the purposes of this section, if an explicit postmark deadline is not specified in an applicable requirement for the submittal of a notification, application, test plan, report, or other written communication to the Administrator, the owner or operator shall postmark the submittal on or before the number of days specified in the applicable requirement. For example, if a notification must be submitted 15 days before a particular event is scheduled to take place, the notification shall be postmarked on or before 15 days preceding the event; likewise, if a notification must be submitted 15 days after a particular event takes place, the notification shall be postmarked on or before 15 days following the end of the event. The use of reliable non-Government mail carriers that provide indications of verifiable delivery of information required to be submitted to the Administrator, similar to the postmark provided by the U.S. Postal Service, or alternative means of delivery agreed to by the Administrator, is acceptable.

(G) Notwithstanding time periods or postmark deadlines specified in this section for the submittal of information to the Administrator by an owner or operator, or the review of such information by the Administrator, such time periods or deadlines may be changed by mutual agreement between the owner or operator and the Administrator. Procedures governing the implementation of this provision are specified in Chapter 5, Section 3(k)(ix).

(H) Special provisions set forth under an applicable subpart or in a relevant standard established under this section shall supersede any conflicting provisions of Chapter 5, Section 3.

(I) Any standards, limitations, prohibitions, or other federally enforceable requirements established pursuant to procedural regulations in this section [including, but not limited to, equivalent emission limitations established pursuant to section 112(g) of the Act] shall have the force and effect of requirements established in this section and shall be subject to the provisions of Chapter 5, Section 3, except when explicitly specified otherwise.

(ii) Initial Applicability Determination For This Section.

(A) The provisions of this section apply to the owner or operator of any stationary source that:

(I) Emits or has the potential to emit any hazardous air pollutant listed in or pursuant to section 112(b) of the Act, and identified below:

CAS Number	Chemical Name
75070	Acetaldehyde
60355	Acetamide
75058	Acetonitrile
98862	Acetophenone
53963	2-Acetylaminofluorene
107028	Acrolein
79061	Acrylamide
79107	Acrylic acid
107131	Acrylonitrile
107051	Allyl chloride
92671	4-Aminobiphenyl
62533	Aniline
90040	o-Anisidine
1332214	Asbestos
71432	Benzene (including benzene from gasoline)
92875	Benzidine
98077	Benzotrichloride
100447	Benzyl chloride
92524	Biphenyl
117817	Bis(2-ethylhexyl)phthalate (DEHP)
542881	Bis(chloromethyl)ether
75252	Bromoform
106990	1,3-Butadiene
156627	Calcium cyanamide
133062	Captan
63252	Carbaryl
75150	Carbon disulfide

CAS Number	Chemical Name
56235	Carbon tetrachloride
463581	Carbonyl sulfide
120809	Catechol
133904	Chloramben
57749	Chlordane
7782505	Chlorine
79118	Chloroacetic acid
532274	2-Chloroacetophenone
108907	Chlorobenzene
510156	Chlorobenzilate
67663	Chloroform
107302	Chloromethyl methyl ether
126998	Chloroprene
1319773	Cresols/Cresylic acid (isomers and mixture)
95487	o-Cresol
108394	m-Cresol
106445	p-Cresol
98828	Cumene
94757	2,4-D, salts and esters
3547044	DDE
334883	Diazomethane
132649	Dibenzofurans
96128	1,2-Dibromo-3-chloropropane
84742	Dibutylphthalate
106467	1,4-Dichlorobenzene(p)
91941	3,3-Dichlorobenzidine
111444	Dichloroethyl ether (Bis(2-chloroethyl)ether)
542756	1,3-Dichloropropene
62737	Dichlorvos
111422	Diethanolamine
121697	N,N-Diethyl aniline (N,N-Dimethylaniline)
64675	Diethyl sulfate
119904	3,3-Dimethoxybenzidine
60117	Dimethyl aminoazobenzene
119937	3,3-Dimethyl benzidine
79447	Dimethyl carbamoyl chloride
68122	Dimethyl formamide
57147	1,1-Dimethyl hydrazine
131113	Dimethyl phthalate
77781	Dimethyl sulfate
534521	4,6-Dinitro-o-cresol, and salts
51285	2,4-Dinitrophenol
121142	2,4-Dinitrotoluene
123911	1,4-Dioxane (1,4-Diethyleneoxide)

CAS Number	Chemical Name
122667	1,2-Diphenylhydrazine
106898	Epichlorohydrin (1-Chloro-2,3-epoxypropane)
106887	1,2-Epoxybutane
140885	Ethyl acrylate
100414	Ethyl benzene
51796	Ethyl carbamate (Urethane)
75003	Ethyl chloride (Chloroethane)
106934	Ethylene dibromide (Dibromoethane)
107062	Ethylene dichloride (1,2-Dichloroethane)
107211	Ethylene glycol
151564	Ethylene imine (Aziridine)
75218	Ethylene oxide
96457	Ethylene thiourea
75343	Ethylidene dichloride (1,1-Dichloroethane)
50000	Formaldehyde
76448	Heptachlor
118741	Hexachlorobenzene
87683	Hexachlorobutadiene
77474	Hexachlorocyclopentadiene
67721	Hexachloroethane
822060	Hexamethylene-1, 6-diisocyanate
680319	Hexamethylphosphoramide
110543	Hexane
302012	Hydrazine
7647010	Hydrochloric acid
7664393	Hydrogen fluoride (Hydrofluoric acid)
123319	Hydroquinone
78591	Isophorone
58899	Lindane (all isomers)
108316	Maleic anhydride
67561	Methanol
72435	Methoxychlor
74839	Methyl bromide (Bromomethane)
74873	Methyl chloride (Chloromethane)
71556	Methyl chloroform (1,1,1-Trichloroethane)
60344	Methyl hydrazine
74884	Methyl iodide (Iodomethane)
108101	Methyl isobutyl ketone (Hexone)
624839	Methyl isocyanate
80626	Methyl methacrylate
1634044	Methyl tert butyl ether
101144	4,4-Methylene bis(2-chloroaniline)
75092	Methylene chloride (Dichloromethane)
101688	Methylene diphenyl diisocyanate (MDI)

CAS Number	Chemical Name
101779	4,4-Methylenedianiline
91203	Naphthalene
98953	Nitrobenzene
92933	4-Nitrobiphenyl
100027	4-Nitrophenol
79469	2-Nitropropane
684935	N-Nitroso-N-methylurea
62759	N-Nitrosodimethylamine
59892	N-Nitrosomorpholine
56382	Parathion
82688	Pentachloronitrobenzene (Quintobenzene)
87865	Pentachlorophenol
108952	Phenol
106503	p-Phenylenediamine
75445	Phosgene
7803512	Phosphine
7723140	Phosphorus
85449	Phthalic anhydride
1336363	Polychlorinated biphenyls (Aroclors)
1120714	1,3-Propane sultone
57578	beta-Propiolactone
123386	Propionaldehyde
114261	Propoxur (Baygon)
78875	Propylene dichloride (1,2-Dichloropropane)
75569	Propylene oxide
75558	1,2-Propylenimine (2-Methyl aziridine)
91225	Quinoline
106514	Quinone
100425	Styrene
96093	Styrene oxide
1746016	2,3,7,8-Tetrachlorodibenzo-p-dioxin
79345	1,1,2,2-Tetrachloroethane
127184	Tetrachloroethylene (Perchloroethylene)
7550450	Titanium tetrachloride
108883	Toluene
95807	2,4-Toluene diamine
584849	2,4-Toluene diisocyanate
95534	o-Toluidine
8001352	Toxaphene (chlorinated camphene)
120821	1,2,4-Trichlorobenzene
79005	1,1,2-Trichloroethane
79016	Trichloroethylene
95954	2,4,5-Trichlorophenol
88062	2,4,6-Trichlorophenol

CAS Number	Chemical Name
121448	Triethylamine
1582098	Trifluralin
540841	2,2,4-Trimethylpentane
108054	Vinyl acetate
593602	Vinyl bromide
75014	Vinyl chloride
75354	Vinylidene chloride (1,1-Dichloroethylene)
95476	o-Xylenes
108383	m-Xylenes
106423	p-Xylenes
0	Antimony Compounds
0	Arsenic Compounds (inorganic including arsine)
0	Beryllium Compounds
0	Cadmium Compounds
0	Chromium Compounds
0	Cobalt Compounds
0	Coke Oven Emissions
0	Cyanide Compounds *1
0	Glycol ethers *2
0	Lead Compounds
0	Manganese Compounds
0	Mercury Compounds
0	Fine mineral fibers *3
0	Nickel Compounds
0	Polycyclic Organic Matter *4
0	Radionuclides (including radon) *5
0	Selenium Compounds

NOTE: For all listings above which contain the word “compounds” and for glycol ethers, the following applies: Unless otherwise specified, these listings are defined as including any unique chemical substance that contains the named chemical (i.e., antimony, arsenic, etc.) as part of that chemical’s infrastructure.

*1 X'CN where X=H' or any other group where a formal dissociation may occur. For example KCN or Ca(CN)₂

*2 Includes mono- and di- ethers of ethylene glycol, diethylene glycol, and triethylene glycol R-(OCH₂CH₂)_n-OR' where

n = 1, 2, or 3

R = alkyl or aryl groups

R' = R, H, or groups which, when removed, yield glycol ethers with the structure:

R-(OCH₂CH)_n-OH. Polymers are excluded from the glycol category.

*3 Includes mineral fiber emissions from facilities manufacturing or processing glass, rock, or slag fibers (or other mineral derived fibers) of average diameter 1 micrometer or less.

*4 Includes organic compounds with more than one benzene ring, and which have a boiling point greater than or equal to 100°C.

*5 A type of atom which spontaneously undergoes radioactive decay.

and,

(II) Is subject to any standard, limitation, prohibition, or other federally enforceable requirement established pursuant to 40 CFR part 63.

(B) In addition to complying with the provisions of this section, the owner or operator of any such source may be required to obtain an operating permit issued in accordance with Chapter 6, Section 3 of the WAQSR.

(C) An owner or operator of a stationary source that emits (or has the potential to emit, without considering controls) one or more hazardous air pollutants who determines that the source is not subject to a relevant standard or other requirement established under this section, shall keep a record of the applicability determination as specified in Chapter 5, Section 3(1)(ii)(C).

(iii) Applicability of This Section After a Relevant Standard Has Been Set.

(A) If a relevant standard has been established under this section, the owner or operator of an affected source shall comply with the provisions of this section and the provisions of that standard, except as specified otherwise in this section or that standard.

(B) If a relevant standard has been established under this section, the owner or operator of an affected source may be required to obtain an operating permit in accordance with Chapter 6, Section 3. Emission standards established in this section for area sources will specify whether:

(I) The Administrator will have the option to exclude area sources affected by that standard from the requirement to obtain an operating permit (i.e., the standard will exempt the category of area sources altogether from the permitting requirement);

(II) The Administrator will have the option to defer permitting of area sources in that category until the EPA takes rulemaking action to determine applicability of the permitting requirements; or

(III) Area sources affected by that emission standard are immediately subject to the requirement to apply for and obtain an operating permit. If a standard fails to specify what the permitting requirements will be for area sources affected by that standard, then area sources that are subject to the standard will be subject

to the requirements to obtain an operating permit without deferral. If the owner or operator is required to obtain an operating permit, the application for such a permit shall be in accordance with Chapter 6, Section 3 of the WAQSR.

(C) If the owner or operator of an existing source obtains an extension of compliance for such source in accordance with the provisions of 40 CFR part 63, Subpart D, the owner or operator shall comply with all requirements of this section except those requirements that are specifically overridden in the extension of compliance for that source.

(D) If an area source that otherwise would be subject to an emission standard or other requirement established under this section if it were a major source subsequently increases its emissions of hazardous air pollutants (or its potential to emit hazardous air pollutants) such that the source is a major source that is subject to the emission standard or other requirement, such source also shall be subject to the notification requirements of this section.

(iv) Applicability of Permit Program Before a Relevant Standard Has Been Set Under This Section. The owner or operator of a stationary source located or proposed for location in Wyoming may be required to obtain an operating permit in accordance with Chapter 6, Section 3 (or revise such a permit if one has already been issued to the source) before a relevant standard is established under this section.

(e) Definitions. The terms used in this section and the designated subparts are defined in the Act or in this subsection as follows:

“Act” means the Clean Air Act (42 U.S.C. 7401 et seq., as amended by Pub. L. 101-549, 104 Stat. 2399).

“Actual emissions” is defined in 40 CFR part 63, Subpart D for the purpose of granting a compliance extension for an early reduction of hazardous air pollutants.

“Administrator” means the Administrator of the Division of Air Quality, Wyoming Department of Environmental Quality.

“Affected source”, for the purposes of this section, means the stationary source, the group of stationary sources, or the portion of a stationary source that is regulated by a relevant standard or other requirement established pursuant to section 112 of the Act. Each relevant standard will define the “affected source” for the purposes of that standard. The term “affected source”, as used in this section, is separate and distinct from any other use of that term in EPA regulations. Sources regulated under Chapter 5, Section 2 of these regulations are not affected sources for the purposes of Chapter 5, Section 3.

“Alternative emission limitation” means conditions established pursuant to sections 112(i)(5) or 112(i)(6) of the Act by the EPA or the Administrator.

“Alternative emission standard” means an alternative means of emission limitation that, after notice and opportunity for public comment, has been demonstrated by an owner or operator to the Administrator’s satisfaction to achieve a reduction in emissions of any air pollutant at least equivalent to the reduction in emissions of such pollutant achieved under a relevant design, equipment, work practice, or operational emission standard, or combination thereof, established under this section pursuant to section 112(h) of the Act.

“Alternative test method” means any method of sampling and analyzing for an air pollutant that is not a test method in 40 CFR part 63 and that has been demonstrated to the Administrator’s satisfaction, using Method 301 in 40 CFR part 63, Appendix A, to produce results adequate for the Administrator’s determination that it may be used in place of a test method specified in this section.

“Area source” means any stationary source of hazardous air pollutants that is not a major source as defined in this section.

“Commenced” means, with respect to construction or reconstruction of a stationary source, that an owner or operator has undertaken a continuous program of construction or reconstruction or that an owner or operator has entered into a contractual obligation to undertake and complete, within a reasonable time, a continuous program of construction or reconstruction.

“Compliance date” means the date by which an affected source is required to be in compliance with a relevant standard, limitation, prohibition, or any federally enforceable requirement established by the EPA or the Administrator pursuant to section 112 of the Act.

“Compliance plan” means a plan that contains all of the following:

(i) A description of the compliance status of the affected source with respect to all applicable requirements established under this section;

(ii) A description as follows:

(A) For applicable requirements for which the source is in compliance, a statement that the source will continue to comply with such requirements;

(B) For applicable requirements that the source is required to comply with by a future date, a statement that the source will meet such requirements on a timely basis;

(C) For applicable requirements for which the source is not in compliance, a narrative description of how the source will achieve compliance with such requirements on a timely basis;

(iii) A compliance schedule, as defined in this subsection; and

(iv) A schedule for the submission of certified progress reports no less frequently than every 6 months for affected sources required to have a schedule of compliance to remedy a violation.

“Compliance schedule” means:

(i) In the case of an affected source that is in compliance with all applicable requirements established under this section, statement that the source will continue to comply with such requirements; or

(ii) In the case of an affected source that is required to comply with applicable requirements by a future date, a statement that the source will meet such requirements on a timely basis and, if required by an applicable requirement, a detailed schedule of the dates by which each step toward compliance will be reached; or

(iii) In the case of an affected source not in compliance with all applicable requirements established under this section, a schedule of remedial measures, including an enforceable sequence of actions or operations with milestones and a schedule for the submission of certified progress reports, where applicable, leading to compliance with a relevant standard, limitation, prohibition, or any federally enforceable requirement established pursuant to section 112 of the Act for which the affected source is not in compliance. This compliance schedule shall resemble and be at least as stringent as that contained in any judicial consent decree or administrative order to which the source is subject. Any such schedule of compliance shall be supplemental to, and shall not sanction noncompliance with, the applicable requirements on which it is based.

“Construction” means the on-site fabrication, erection, or installation of an affected source.

“Continuous emission monitoring system” (CEMS) means the total equipment that may be required to meet the data acquisition and availability requirements of this section, used to sample, condition (if applicable), analyze, and provide a record of emissions.

“Continuous monitoring system” (CMS) is a comprehensive term that may include, but is not limited to, continuous emission monitoring systems, continuous opacity monitoring systems, continuous parameter monitoring systems, or other manual or automatic monitoring that is used for demonstrating compliance with an applicable regulation on a continuous basis as defined by the regulation.

“Continuous opacity monitoring system” (COMS) means a continuous monitoring system that measures the opacity of emissions.

“Continuous parameter monitoring system” means the total equipment that may be required to meet the data acquisition and availability requirements of this section, used to sample, condition (if applicable), analyze, and provide a record of process or control system parameters.

“Effective date” means:

(i) With regard to an emission standard in this section, the date of promulgation in the Federal Register. The effective date is designated in the applicable subparts of the national emission standards for hazardous air pollutants (NESHAP) referenced in Chapter 5, Section 3(b) and contained in 40 CFR part 63, or

(ii) With regard to an alternative emission limitation or equivalent emission limitation determined by the Administrator, the date that the alternative emission limitation or equivalent emission limitation becomes effective according to the provisions of this section.

“Emission standard” means a national standard, limitation, prohibition, or other regulation promulgated in a subpart of this section pursuant to sections 112(d), 112(h), or 112(f) of the Act.

“Emissions averaging” is a way to comply with the emission limitations specified in a relevant standard, whereby an affected source, if allowed under a subpart of this section, may create emission credits by reducing emissions from specific points to a level below that required by the relevant standard, and those credits are used to offset emissions from points that are not controlled to the level required by the relevant standard.

“EPA” means the Administrator of the United States Environmental Protection Agency or the Administrator’s designee.

“Equivalent emission limitation” means the maximum achievable control technology emission limitation (MACT emission limitation) for hazardous air pollutants that the Administrator determines on a case-by-case basis, pursuant to section 112(g) or section 112(j) of the Act, to be equivalent to the emission standard that would apply to an affected source if such standard had been promulgated by the EPA under 40 CFR part 63 pursuant to section 112(d) or section 112(h) of the Act.

“Excess emissions and continuous monitoring system performance report” is a report that must be submitted periodically by an affected source in order to

provide data on its compliance with relevant emission limits, operating parameters, and the performance of its continuous parameter monitoring systems.

“Existing source” means any affected source that is not a new source.

“Federally enforceable” means all limitations and conditions that are enforceable by the EPA and citizens under the Act or that are enforceable under other statutes administered by the EPA.

“Fixed capital cost” means the capital needed to provide all the depreciable components of an existing source.

“Fugitive emissions” means those emissions from a stationary source that could not reasonably pass through a stack, chimney, vent, or other functionally equivalent opening. Under section 112 of the Act, all fugitive emissions are to be considered in determining whether a stationary source is a major source.

“Hazardous air pollutant” means any air pollutant listed in or pursuant to section 112(b) of the Act, and listed in subsection (d)(ii)(A)(I) of this section.

“Issuance” of an operating permit will occur, in accordance with Chapter 6, Section 3.

“Lesser quantity” means a quantity of a hazardous air pollutant that is or may be emitted by a stationary source that the EPA establishes in order to define a major source under an applicable subpart of this section.

“Major source” means any stationary source or group of stationary sources located within a contiguous area and under common control that emits or has the potential to emit considering controls, in the aggregate, 10 tons per year or more of any hazardous air pollutant or 25 tons per year or more of any combination of hazardous air pollutants, unless the EPA establishes a lesser quantity, or in the case of radionuclides, different criteria from those specified in this sentence.

“Malfunction” means any sudden, infrequent, and not reasonably preventable failure of air pollution control equipment, process equipment, or a process to operate in a normal or usual manner. Failures that are caused in part by poor maintenance or careless operation are not malfunctions.

“New source” means any affected source the construction or reconstruction of which is commenced after the EPA first proposes a relevant emission standard under 40 CFR part 63.

“One-hour period”, unless otherwise defined in an applicable subpart, means any 60-minute period commencing on the hour.

“Opacity” means the degree to which emissions reduce the transmission of light and obscure the view of an object in the background. For continuous opacity monitoring systems, opacity means the fraction of incident light that is attenuated by an optical medium.

“Operating permit” or “part 70 permit” means any permit or group of permits covering a source under Chapter 6, Section 3 that is issued, renewed, amended, or revised pursuant to Chapter 6, Section 3.

“Owner or operator” means any person who owns, leases, operates, controls, or supervises a stationary source.

“Performance audit” means a procedure to analyze blind samples, the content of which is known by the Administrator, simultaneously with the analysis of performance test samples in order to provide a measure of test data quality.

“Performance evaluation” means the conduct of relative accuracy testing, calibration error testing, and other measurements used in validating the continuous monitoring system data.

“Performance test” means the collection of data resulting from the execution of a test method (usually three emission test runs) used to demonstrate compliance with a relevant emission standard as specified in the performance test section of the relevant standard.

“Permit modification” means a change to an operating permit as defined in Chapter 6, Section 3 of the WAQSR.

“Permit program” means the comprehensive State operating permit system established pursuant to title V of the Act (42 U.S.C. 7661) and regulations in Chapter 6, Section 3.

“Permit revision” means any permit modification or administrative permit amendment to an operating permit as defined in Chapter 6, Section 3.

“Potential to emit” means the maximum capacity of a stationary source to emit a pollutant under its physical and operational design. Any physical or operational limitation on the capacity of the stationary source to emit a pollutant, including air pollution control equipment and restrictions on hours of operation or on the type or amount of material combusted, stored, or processed, shall be treated as part of its design if the limitation or the effect it would have on emissions is federally enforceable.

“Reconstruction” means the replacement of components of an affected or a previously unaffected stationary source to such an extent that:

(i) The fixed capital cost of the new components exceeds 50 percent of the fixed capital cost that would be required to construct a comparable new source; and

(ii) It is technologically and economically feasible for the reconstructed source to meet the relevant standard(s) established by the EPA pursuant to section 112 of the Act. Upon reconstruction, an affected source, or a stationary source that becomes an affected source, is subject to relevant standards for new sources, including compliance dates, irrespective of any change in emissions of hazardous air pollutants from that source.

“Regulation promulgation schedule” means the schedule for the promulgation of emission standards under 40 CFR part 63, established by the EPA pursuant to section 112(e) of the Act and published in the Federal Register.

“Relevant standard” means:

- (i) An emission standard;
- (ii) An alternative emission standard;
- (iii) An alternative emission limitation; or

(iv) An equivalent emission limitation established pursuant to section 112 of the Act that applies to the stationary source, the group of stationary sources, or the portion of a stationary source regulated by such standard or limitation.

A relevant standard may include or consist of a design, equipment, work practice, or operational requirement, or other measure, process, method, system, or technique (including prohibition of emissions) that the EPA establishes for new or existing sources to which such standard or limitation applies. Every relevant standard established pursuant to section 112 of the Act includes the provisions of Chapter 5, Section 3 and all applicable appendices that are referenced in that standard.

“Responsible official” means one of the following:

(i) For a Corporation: a president, secretary, treasurer, or vice president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision-making functions for the corporation, or a duly authorized representative of such person if the representative is responsible for the overall operation of one or more manufacturing, production, or operating facilities and either:

(A) The facilities employ more than 250 persons or have gross annual sales or expenditures exceeding \$25 million (in second Quarter 1980 dollars); or

(B) The delegation of authority to such representative is approved in advance by the Administrator.

(ii) For a Partnership or Sole Proprietorship: a general partner or the proprietor, respectively.

(iii) For a Municipality, State, Federal, or Other Public Agency: either a principal executive officer or ranking elected official. For the purposes of this section, a principal executive officer of a Federal agency includes the chief executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., a Regional Administrator of the EPA).

(iv) For Affected Sources (as defined in this section) Applying for or Subject to an Operating Permit: “responsible official” shall have the same meaning as defined in Chapter 6, Section 3.

“Run” means one of a series of emission or other measurements needed to determine emissions for a representative operating period or cycle as specified in this section.

“Shutdown” means the cessation of operation of an affected source for any purpose.

“Six-minute period” means, with respect to opacity determinations, any one of the 10 equal parts of a 1-hour period.

“Standard conditions” means a temperature of 293°K (68°F) and a pressure of 101.3 Kilopascals of Hg (29.92 in. of Hg).

“Startup” means the setting in operation of an affected source for any purpose.

“State” means the State of Wyoming.

“Stationary source” means any building, structure, facility, or installation which emits or may emit any air pollutant.

“Test method” means the validated procedure for sampling, preparing, and analyzing for an air pollutant specified in a relevant standard as the performance test procedure. The test method may include methods described in an appendix of 40 CFR

part 63 or methods validated for an application through procedures in Method 301 of 40 CFR part 63, Appendix A.

“Visible emission” means the observation of an emission of opacity or optical density above the threshold of vision.

“WAQSR” means the Wyoming Air Quality Standards and Regulations promulgated under the Wyoming Environmental Quality Act, W.S. §35-11-101 et seq.

(f) Units and Abbreviations. The abbreviations and symbols for the units of measure used in this section, are defined as follows:

(i) System International (SI) Units of Measure:

A = ampere
g = gram
Hz = hertz
J = joule
°K = degree Kelvin
kg = kilogram
l = liter
m = meter
m³ = cubic meter
mg = milligram = 10⁻³ gram
ml = milliliter = 10⁻³ liter
mm = millimeter = 10⁻³ meter
Mg = megagram = 10⁶ gram = metric ton
MJ = megajoule
mol = mole
N = newton
ng = nanogram = 10⁻⁹ gram
nm = nanometer = 10⁻⁹ meter
Pa = pascal
s = second
V = volt
W = watt
Ω = ohm
μg = microgram = 10⁻⁶ gram
μl = microliter = 10⁻⁶ liter

(ii) Other Units of Measure:

Btu = British thermal unit
°C = degree Celsius (centigrade)
cal = calorie
cfm = cubic feet per minute
cc = cubic centimeter

cu ft = cubic feet
d = day
dcf = dry cubic feet
dcm = dry cubic meter
dscf = dry cubic feet at standard conditions
dscm = dry cubic meter at standard conditions
eq = equivalent
°F = degree Fahrenheit
ft = feet
ft² = square feet
ft³ = cubic feet
gal = gallon
gr = grain
g-eq = gram equivalent
g-mole = gram mole
hr = hour
in. = inch
in. H₂O = inches of water
K = 1,000
kcal = kilocalorie
lb = pound
lpm = liter per minute
meq = milliequivalent
min = minute
MW = molecular weight
oz = ounces
ppb = parts per billion
ppbw = parts per billion by weight
ppbv = parts per billion by volume
ppm = parts per million
ppmw = parts per million by weight
ppmv = parts per million by volume
psia = pounds per square inch absolute
psig = pounds per square inch gage
°R = degree Rankine
scf = cubic feet at standard conditions
scfh = cubic feet at standard conditions per hour
scm = cubic meter at standard conditions
sec = second
sq ft = square feet
std = at standard conditions
v/v = volume per volume
yd² = square yards
yr = year

(iii) Miscellaneous:

act = actual
avg = average
I.D. = inside diameter
M = molar
N = normal
O.D. = outside diameter
% = percent

(g) Prohibited Activities and Circumvention.

(i) Prohibited Activities.

(A) No owner or operator subject to the provisions of this section shall operate any affected source in violation of the requirements of this section except under:

(I) An extension of compliance granted by the EPA under this section; or

(II) An extension of compliance granted under this section by the Administrator; or

(III) An exemption from compliance granted by the President under section 112(i)(4) of the Act.

(B) No owner or operator subject to the provisions of this section shall fail to keep records, notify, report, or revise reports as required under this section.

(C) No owner or operator of an affected source, who is required under this section to obtain an operating permit, shall operate such source except in compliance with the provisions of this section and the applicable requirements of Chapter 6, Section 3.

(D) An owner or operator of an affected source who is subject to an emission standard promulgated under this section shall comply with the requirements of that standard by the date(s) established in the applicable subpart(s) of this section regardless of whether:

(I) An operating permit has been issued to that source; or

(II) If an operating permit has been issued to that source, whether such permit has been revised or modified to incorporate the emission standard.

(ii) Circumvention. No owner or operator subject to the provisions of this section shall build, erect, install, or use any article, machine, equipment, or process to conceal an emission that would otherwise constitute noncompliance with a relevant standard. Such concealment includes, but is not limited to:

(A) The use of diluents to achieve compliance with a relevant standard based on the concentration of a pollutant in the effluent discharged to the atmosphere;

(B) The use of gaseous diluents to achieve compliance with a relevant standard for visible emissions; and

(C) The fragmentation of an operation such that the operation avoids regulation by a relevant standard.

(iii) Severability. Notwithstanding any requirement incorporated into an operating permit obtained by an owner or operator subject to the provisions of this section, the provisions of this section are federally enforceable.

(h) Compliance With Standards and Maintenance Requirements.

(i) Applicability.

(A) The requirements in this subsection apply to owners or operators of affected sources for which any relevant standard has been established pursuant to section 112 of the Act unless:

(I) The Administrator has granted an extension of compliance consistent with paragraph (viii) of this subsection; or

(II) The President has granted an exemption from compliance with any relevant standard in accordance with section 112(i)(4) of the Act.

(B) If an area source that otherwise would be subject to an emission standard or other requirement established under this section if it were a major source subsequently increases its emissions of hazardous air pollutants (or its potential to emit hazardous air pollutants) such that the source is a major source, such source shall be subject to the relevant emission standard or other requirement.

(ii) Compliance Dates for New and Reconstructed Sources.

(A) Except as specified in paragraphs (ii)(C) and (ii)(D) of this subsection, the owner or operator of a new or reconstructed source that has an initial startup before the effective date of a relevant standard established under this section

pursuant to sections 112(d), 112(f), or 112(h) of the Act shall comply with such standard not later than the standard's effective date.

(B) Except as specified in paragraphs (ii)(C) and (ii)(D) of this subsection, the owner or operator of a new or reconstructed source that has an initial startup after the effective date of a relevant standard established under this section pursuant to sections 112(d), 112(f), or 112(h) of the Act shall comply with such standard upon startup of the source.

(C) The owner or operator of an affected source for which construction or reconstruction is commenced after the proposal date of a relevant standard established under this section pursuant to sections 112(d), 112(f), or 112(h) of the Act but before the effective date (that is, promulgation) of such standard shall comply with the relevant emission standard not later than the date 3 years after the effective date if:

(I) The promulgated standard (that is, the relevant standard) is more stringent than the proposed standard; and

(II) The owner or operator complies with the standard as proposed during the 3-year period immediately after the effective date.

(D) The owner or operator of an affected source for which construction or reconstruction is commenced after the proposal date of a relevant standard established pursuant to section 112(d) of the Act but before the proposal date of a relevant standard established pursuant to section 112(f) shall comply with the emission standard under section 112(f) not later than the date 10 years after the date construction or reconstruction is commenced, except that, if the section 112(f) standard is promulgated more than 10 years after construction or reconstruction is commenced, the owner or operator shall comply with the standard as provided in paragraphs (ii)(A) and (ii)(B) of this subsection.

(E) The owner or operator of a new source that is subject to the compliance requirements of paragraph (ii)(C) or paragraph (ii)(D) of this subsection shall notify the Administrator in accordance with subsection (k)(iv) of this section.

(F) After the effective date of an emission standard promulgated under this section, the owner or operator of an unaffected new area source (i.e., an area source for which construction or reconstruction was commenced after the proposal date of the standard) that increases its emissions of (or its potential to emit) hazardous air pollutants such that the source becomes a major source that is subject to the emission standard, shall comply with the relevant emission standard immediately upon becoming a major source. This compliance date shall apply to new area sources that become affected major sources regardless of whether the new area source previously was affected by that standard. The new affected major source shall comply with all requirements of that standard that affect new sources.

(iii) Compliance Dates for Existing Sources.

(A) After the effective date of a relevant standard established under this section pursuant to section 112(d) or 112(h) of the Act, the owner or operator of an existing source shall comply with such standard by the compliance date in the applicable subpart(s) of this section. Except as otherwise provided for in section 112 of the Act, in no case will the compliance date established for an existing source in an applicable subpart of this section exceed 3 years after the effective date of such standard.

(B) After the effective date of a relevant standard established under this section pursuant to section 112(f) of the Act, the owner or operator of an existing source shall comply with such standard not later than 90 days after the standard's effective date unless the Administrator has granted an extension to the source under paragraph (viii)(D)(II) of this subsection.

(C) After the effective date of an emission standard promulgated under this section, the owner or operator of an unaffected existing area source that increases its emissions of (or its potential to emit) hazardous air pollutants such that the source becomes a major source that is subject to the emission standard shall comply by the date specified in the standard for existing area sources that become major sources. If no such compliance date is specified in the standard, the source shall have a period of time to comply with the relevant emission standard that is equivalent to the compliance period specified in that standard for other existing sources. This compliance period shall apply to existing area sources that become affected major sources regardless of whether the existing area source previously was affected by that standard. Notwithstanding the previous two sentences, however, if the existing area source becomes a major source by the addition of a new affected source or by reconstructing, the portion of the existing facility that is a new affected source or a reconstructed source shall comply with all requirements of that standard that affect new sources, including the compliance date for new sources.

(iv) Operation and Maintenance Requirements.

(A) (I) At all times, including periods of startup, shutdown, and malfunction, owners or operators shall operate and maintain any affected source, including associated air pollution control equipment, in a manner consistent with good air pollution control practices for minimizing emissions at least to the levels required by all relevant standards.

(II) Malfunctions shall be corrected as soon as practicable after their occurrence in accordance with the startup, shutdown, and malfunction plan required in paragraph (iv)(C) of this subsection.

(III) Operation and maintenance requirements established pursuant to section 112 of the Act are enforceable independent of emissions limitations or other requirements in relevant standards.

(B) Determination of whether acceptable operation and maintenance procedures are being used will be based on information available to the Administrator which may include, but is not limited to, monitoring results, review of operation and maintenance procedures [including the startup, shutdown, and malfunction plan required in paragraph (iv)(C) of this subsection], review of operation and maintenance records, and inspection of the source.

(C) Startup, Shutdown, and Malfunction Plan.

(I) The owner or operator of an affected source shall develop and implement a written startup, shutdown, and malfunction plan that describes, in detail, procedures for operating and maintaining the source during periods of startup, shutdown, and malfunction and a program of corrective action for malfunctioning process and air pollution control equipment used to comply with the relevant standard. As required under subsection (k)(iii)(A)(I), the plan shall identify all routine or otherwise predictable CMS malfunctions. This plan shall be developed by the owner or operator by the source's compliance date for that relevant standard. The plan shall be incorporated by reference into the source's operating permit. The purpose of the startup, shutdown, and malfunction plan is to:

(1.) Ensure that, at all times, owners or operators operate and maintain affected sources, including associated air pollution control equipment, in a manner consistent with good air pollution control practices for minimizing emissions at least to the levels required by all relevant standards;

(2.) Ensure that owners or operators are prepared to correct malfunctions as soon as practicable after their occurrence in order to minimize excess emissions of hazardous air pollutants; and

(3.) Reduce the reporting burden associated with periods of startup, shutdown, and malfunction (including corrective action taken to restore malfunctioning process and air pollution control equipment to its normal or usual manner of operation).

(II) During periods of startup, shutdown, and malfunction, the owner or operator of an affected source shall operate and maintain such source (including associated air pollution control equipment) in accordance with the procedures specified in the startup, shutdown, and malfunction plan developed under paragraph (iv)(C)(I) of this subsection.

(III) When actions taken by the owner or operator during a startup, shutdown, or malfunction (including actions taken to correct a malfunction) are consistent with the procedures specified in the affected source's startup, shutdown, and malfunction plan, the owner or operator shall keep records for that event that demonstrate that the procedures specified in the plan were followed. These records may take the form of a "checklist", or other effective form of recordkeeping, that confirms conformance with the startup, shutdown, and malfunction plan for that event. In addition, the owner or operator shall keep records of these events as specified in subsection (I)(ii) (and elsewhere in this section) including records of the occurrence and duration of each startup, shutdown, or malfunction of operation and each malfunction of the air pollution control equipment. Furthermore, the owner or operator shall confirm that actions taken during the relevant reporting period during periods of startup, shutdown, and malfunction were consistent with the affected source's startup, shutdown and malfunction plan in the semiannual (or more frequent) startup, shutdown, and malfunction report required in subsection (I)(iv)(E).

(IV) If an action taken by the owner or operator during a startup, shutdown, or malfunction (including an action taken to correct a malfunction) is not consistent with the procedures specified in the affected source's startup, shutdown, and malfunction plan, the owner or operator shall record the actions taken for that event and shall report such actions with 24 hours after commencing actions inconsistent with the plan, followed by a letter within 7 working days after the end of the event, in accordance with subsection (I)(iv)(E) (unless the owner or operator makes alternative reporting arrangements, in advance, with the Administrator [see subsection (I)(iv)(E)(II)]).

(V) The owner or operator shall keep the written startup, shutdown, and malfunction plan on record after it is developed to be made available for inspection, upon request, by the Administrator for the life of the affected source or until the affected source is no longer subject to the provisions of this section. In addition, if the startup, shutdown, and malfunction plan is revised, the owner or operator shall keep previous (i.e., superseded) versions of the startup, shutdown, and malfunction plan on record, to be made available for inspection, upon request, by the Administrator, for a period of 5 years after each revision to the plan.

(VI) To satisfy the requirements of this subsection to develop a startup, shutdown, and malfunction plan, the owner or operator may use the affected source's standard operating procedures (SOP) manual, or an Occupational Safety and Health Administration (OSHA) or other plan, provided the alternative plans meet all the requirements of this subsection and are made available for inspection when requested by the Administrator.

(VII) Based on the results of a determination made under paragraph (iv)(B) of this subsection, the Administrator may require that an owner or operator of an affected source make changes to the startup, shutdown, and malfunction

plan for that source. The Administrator may require reasonable revisions to a startup, shutdown, and malfunction plan, if the Administrator finds that the plan:

- (1.) Does not address a startup, shutdown, or malfunction event that has occurred;
- (2.) Fails to provide for the operation of the source (including associated air pollution control equipment) during a startup, shutdown, or malfunction event in a manner consistent with good air pollution control practices for minimizing emissions at least to the levels required by all relevant standards; or
- (3.) Does not provide adequate procedures for correcting malfunctioning process and/or air pollution control equipment as quickly as practicable.

(VIII) If the startup, shutdown, and malfunction plan fails to address or inadequately addresses an event that meets the characteristics of a malfunction but was not included in the startup, shutdown, and malfunction plan at the time the owner or operator developed the plan, the owner or operator shall revise the startup, shutdown, and malfunction plan within 45 days after the event to include detailed procedures for operating and maintaining the source during similar malfunction events and a program of corrective action for similar malfunctions of process or air pollution control equipment.

(v) Compliance With Nonopacity Emission Standards.

(A) Applicability. The nonopacity emission standards set forth in this section shall apply at all times except during periods of startup, shutdown, and malfunction, and as otherwise specified in an applicable subpart.

(B) Methods for Determining Compliance.

(I) The Administrator will determine compliance with nonopacity emission standards in this section based on the results of performance tests conducted according to the procedures in subsection (i), unless otherwise specified in an applicable subpart of this section.

(II) The Administrator will determine compliance with nonopacity emission standards in this section by evaluation of an owner or operator's conformance with operation and maintenance requirements, including the evaluation of monitoring data, as specified in subsection (h)(iv) and applicable subparts of this section.

(III) If an affected source conducts performance testing at startup to obtain an operating permit in the State, the results of such testing may be used to demonstrate compliance with a relevant standard if:

(1.) The performance test was conducted within a reasonable amount of time before an initial performance test is required to be conducted under the relevant standard;

(2.) The performance test was conducted under representative operating conditions for the source;

(3.) The performance test was conducted and the resulting data were reduced using EPA-approved test methods and procedures, as specified in subsection (i)(v) of this section; and

(4.) The performance test was appropriately quality-assured, as specified in subsection (i)(iii) of this section.

(IV) The Administrator will determine compliance with design, equipment, work practice, or operational emission standards in this section by review of records, inspection of the source, and other procedures specified in applicable subparts of this section.

(V) The Administrator will determine compliance with design, equipment, work practice, or operational emission standards in this section by evaluation of an owner or operator's conformance with operation and maintenance requirements, as specified in paragraph (iv) of this section and applicable subparts of this section.

(C) Finding of compliance. The Administrator will make a finding concerning an affected source's compliance with a nonopacity emission standard, as specified in paragraphs (v)(A) and (v)(B) of this subsection, upon obtaining all the compliance information required by the relevant standard (including the written reports of performance test results, monitoring results, and other information, if applicable) and any information available to the Administrator needed to determine whether proper operation and maintenance practices are being used.

(vi) Use of an Alternative Nonopacity Emission Standard.

(A) If, in the EPA's judgment, an owner or operator of an affected source has established that an alternative means of emission limitation will achieve a reduction in emissions of a hazardous air pollutant from an affected source at least equivalent to the reduction in emissions of that pollutant from that source achieved under any design, equipment, work practice, or operational emission standard, or combination thereof, established under this section, pursuant to section 112(h) of the Act, the EPA will publish in the Federal Register a notice permitting the use of the alternative emission standard for purposes of compliance with the promulgated standard. Any Federal Register notice under this paragraph shall be published only after the public is notified

and given the opportunity to comment. Such notice will restrict the permission to the stationary source(s) or category(ies) of sources from which the alternative emission standard will achieve equivalent emission reductions. The EPA will condition permission in such notice on requirements to assure the proper operation and maintenance of equipment and practices required for compliance with the alternative emission standard and other requirements, including appropriate quality assurance and quality control requirements, that are deemed necessary.

(B) An owner or operator requesting permission under this paragraph shall, unless otherwise specified in an applicable subpart, submit a proposed test plan or the results of testing and monitoring in accordance with subsection (i) and subsection (j), a description of the procedures followed in testing or monitoring, and a description of pertinent conditions during testing or monitoring. Any testing or monitoring conducted to request permission to use an alternative nonopacity emission standard shall be appropriately quality assured and quality controlled, as specified in subsection (i) and subsection (j).

(C) The EPA may establish general procedures in an applicable subpart that accomplish the requirements of paragraphs (vi)(A) and (vi)(B) of this subsection.

(vii) Compliance With Opacity and Visible Emission Standards.

(A) Applicability. The opacity and visible emission standards set forth in this section shall apply at all times except during periods of startup, shutdown, and malfunction, and as otherwise specified in an applicable subpart.

(B) Methods for Determining Compliance.

(I) The Administrator will determine compliance with opacity and visible emission standards in this section based on the results of the test method specified in an applicable subpart. Whenever a continuous opacity monitoring system (COMS) is required to be installed to determine compliance with numerical opacity emission standards in this section, compliance with opacity emission standards in this section shall be determined by using the results from the COMS. Whenever an opacity emission test method is not specified, compliance with opacity emission standards in this section shall be determined by conducting observations in accordance with Test Method 9 in 40 CFR part 60, Appendix A or the method specified in paragraph (vii)(F)(II) of this subsection. Whenever a visible emission test method is not specified, compliance with visible emission standards in this section shall be determined by conducting observations in accordance with Test Method 22 in 40 CFR part 60, Appendix A.

(II) If an affected source undergoes opacity or visible emission testing at startup to obtain an operating permit in the State, the results of such testing may be used to demonstrate compliance with a relevant standard if:

(1.) The opacity or visible emission test was conducted within a reasonable amount of time before a performance test is required to be conducted under the relevant standard;

(2.) The opacity or visible emission test was conducted under representative operating conditions for the source;

(3.) The opacity or visible emission test was conducted and the resulting data were reduced using EPA-approved test methods and procedures, as specified in subsection (i)(v) of this section; and

(4.) The opacity or visible emission test was appropriately quality-assured, as specified in subsection (i)(iii) of this section.

(C) Notification of opacity or visible emission observations. The owner or operator of an affected source shall notify the Administrator in writing of the anticipated date for conducting opacity or visible emission observations in accordance with subsection (k)(vi), if such observations are required for the source by a relevant standard.

(D) Conduct of opacity or visible emission observations. When a relevant standard under this section includes an opacity or visible emission standard, the owner or operator of an affected source shall comply with the following:

(I) For the purpose of demonstrating initial compliance, opacity or visible emission observations shall be conducted concurrently with the initial performance test required in subsection (i) unless one of the following conditions applies:

(1.) If no performance test under subsection (i) is required, opacity or visible emission observations shall be conducted with 60 days after achieving the maximum production rate at which a new or reconstructed source will be operated, but not later than 120 days after initial startup of the source, or within 120 days after the effective date of the relevant standard in the case of new sources that start up before the standard's effective date. If no performance test under subsection (i) is required, opacity or visible emission observations shall be conducted within 120 days after the compliance date for an existing or modified source; or

(2.) If visibility or other conditions prevent the opacity or visible emission observations from being conducted concurrently with the initial performance test required under subsection (i), or within the time period specified in paragraph (vii)(D)(I)(1.) of this subsection, the source's owner or operator shall reschedule the opacity or visible emission observations as soon after the initial performance test, or time period, as possible, but not later than 30 days thereafter, and shall advise the Administrator of the rescheduled date. The rescheduled opacity or visible

emission observations shall be conducted (to the extent possible) under the same operating conditions that existed during the initial performance test conducted under subsection (i). The visible emissions observer shall determine whether visibility or other conditions prevent the opacity or visible emission observations from being made concurrently with the initial performance test in accordance with procedures contained in Test Method 9 or Test Method 22 in 40 CFR part 60, Appendix A.

(II) For the purpose of demonstrating initial compliance, the minimum total time of opacity observations shall be 3 hours (30 6-minute averages) for the performance test or other required set of observations (e.g., for fugitive-type emission sources subject only to an opacity emission standard).

(III) The owner or operator of an affected source to which an opacity or visible emission standard in this section applies shall conduct opacity or visible emission observations in accordance with the provisions of this subsection, record the results of the evaluation of emissions, and report to the Administrator the opacity or visible emission results in accordance with the provisions of subsection (I)(iv).

(IV) Opacity readings of portions of plumes that contain condensed, uncombined water vapor shall not be used for the purposes of determining compliance with opacity emission standards.

(E) Availability of Records. The owner or operator of an affected source shall make available, upon request by the Administrator, such records that the Administrator deems necessary to determine the conditions under which the visual observations were made and shall provide evidence indicating proof of current visible observer emission certification.

(F) Use of a Continuous Opacity Monitoring System.

(I) The owner or operator of an affected source required to use a continuous opacity monitoring system (COMS) shall record the monitoring data produced during a performance test required under subsection (i) and shall furnish the Administrator a written report of the monitoring results in accordance with the provisions of subsection (I)(v)(D).

(II) Whenever an opacity emission test method has not been specified in an applicable subpart, or an owner or operator of an affected source is required to conduct Test Method 9 observations (see 40 CFR part 60, Appendix A), the owner or operator may submit, for compliance purposes, COMS data results produced during any performance test required under subsection (I) in lieu of Method 9 data. If the owner or operator elects to submit COMS data for compliance with the opacity emission standard, the Administrator shall be notified of that decision, in writing, simultaneously with the notification under subsection (I)(ii) of the date the performance test is scheduled to begin. Once the owner or operator of an affected source has notified the Administrator

to that effect, the COMS data results will be used to determine opacity compliance during subsequent performance tests required under subsection (l), unless the owner or operator notifies the Administrator in writing to the contrary not later than with the notification under subsection (l)(ii) of the date the subsequent performance test is scheduled to begin.

(III) For the purposes of determining compliance with the opacity emission standard during a performance test required under subsection (l) using COMS data, the COMS data shall be reduced to 6-minute averages over the duration of the mass emission performance test.

(IV) The owner or operator of an affected source using a COMS for compliance purposes is responsible for demonstrating compliance with the performance evaluation requirements of subsection (j)(v), that the COMS has been properly maintained, operated, and data quality-assured, as specified in subsection (j)(iii) and subsection (j)(iv), and that the resulting data have not been altered in any way.

(V) Except as provided in paragraph (vii)(F)(II) of this subsection, the results of continuous monitoring by a COMS that indicate that the opacity at the time visual observations were made was not in excess of the emission standard are probative but not conclusive evidence of the actual opacity of an emission, provided that the affected source proves that, at the time of the alleged violation, the instrument used was properly maintained, as specified in subsection (j)(iii), and met Performance Specification 1 in 40 CFR part 60, Appendix B, and that the resulting data have not been altered in any way.

(G) Finding of Compliance. The Administrator will make a finding concerning an affected source's compliance with an opacity or visible emission standard upon obtaining all the compliance information required by the relevant standard (including the written reports of the results of the performance tests required by subsection (i), the results of Test Method 9 or another required opacity or visible emission test method, the observer certification required by paragraph (vii)(E) of this subsection, and the continuous opacity monitoring system results, whichever is/are applicable) and any information available to the Administrator needed to determine whether proper operation and maintenance practices are being used.

(H) Adjustment to an Opacity Emission Standard.

(I) If the EPA finds under paragraph (vii)(G) of this subsection that an affected source is in compliance with all relevant standards for which initial performance tests were conducted under subsection (i), but during the time such performance tests were conducted fails to meet any relevant opacity emission standard, the owner or operator of such source may petition the EPA to make appropriate adjustment to the opacity emission standard for the affected source. Until the EPA notifies the owner or operator of the appropriate adjustment, the relevant opacity emission standard remains applicable.

(II) The EPA may grant such a petition upon a demonstration by the owner or operator that:

(1.) The affected source and its associated air pollution control equipment were operated and maintained in a manner to minimize the opacity of emissions during the performance tests;

(2.) The performance tests were performed under the conditions established by the EPA; and

(3.) The affected source and its associated air pollution control equipment were incapable of being adjusted or operated to meet the relevant opacity emission standard.

(III) The EPA will establish an adjusted opacity emission standard for the affected source meeting the above requirements at a level at which the source will be able, as indicated by the performance and opacity tests, to meet the opacity emission standard at all times during which the source is meeting the mass or concentration emission standard. The EPA will promulgate the new opacity emission standard in the Federal Register.

(IV) After the EPA promulgates an adjusted opacity emission standard for an affected source, the owner or operator of such source shall be subject to the new opacity emission standard, and the new opacity emission standard shall apply to such source during any subsequent performance tests.

(viii) Extension of Compliance With Emission Standards.

(A) Until an extension of compliance has been granted by the Administrator under this paragraph, the owner or operator of an affected source subject to the requirements of this subsection shall comply with all applicable requirements of this section.

(B) Extension of Compliance for Early Reductions and Other Reductions.

(I) Early Reductions. Pursuant to section 112(i)(5) of the Act, if the owner or operator of an existing source demonstrates that the source has achieved a reduction in emissions of hazardous air pollutants in accordance with the provisions of 40 CFR part 63, Subpart D, the Administrator will grant the owner or operator an extension of compliance with specific requirements of this section, as specified in 40 CFR part 63, Subpart D.

(II) Other Reductions. Pursuant to section 112(i)(6) of the Act, if the owner or operator of an existing source has installed best available control technology (BACT) [as defined in section 169(3) of the Act] or technology required to meet a lowest achievable emission rate (LAER) (as defined in section 171 of the Act) prior to the promulgation of an emission standard, applicable to such source and the same pollutant (or stream of pollutants) controlled pursuant to the BACT or LAER installation, the Administrator will grant the owner or operator an extension of compliance with such emission standard that will apply until the date 5 years after the date on which such installation was achieved, as determined by the Administrator.

(C) Request for Extension of Compliance. Paragraphs (viii)(D) through (viii)(G) of this subsection concern requests for an extension of compliance with a relevant standard under this section [except requests for an extension of compliance under paragraph (viii)(B)(I) of this subsection will be handled through procedures specified in 40 CFR part 63, Subpart D].

(D) (I) (1.) The owner or operator of an existing source who is unable to comply with a relevant standard established under this section pursuant to section 112(d) of the Act may request that the Administrator grant an extension allowing the source up to 1 additional year to comply with the standard, if such additional period is necessary for the installation of controls. An additional extension of up to 3 years may be added for mining waste operations, if the 1-year extension of compliance is insufficient to dry and cover mining waste in order to reduce emissions of any hazardous air pollutant. The owner or operator of an affected source who has requested an extension of compliance under this paragraph and who is otherwise required to obtain an operating permit shall apply for such permit or apply to have the source's operating permit revised to incorporate the conditions of the extension of compliance. The conditions of an extension of compliance granted under this paragraph will be incorporated into the affected source's operating permit according to the provisions of Chapter 6, Section 3.

(2.) Any request under this paragraph for an extension of compliance with a relevant standard shall be submitted in writing to the Administrator not later than 12 months before the affected source's compliance date [as specified in paragraphs (ii) and (iii) of this subsection] for sources that are not including emission points in an emissions average, or not later than 18 months before the affected source's compliance date [as specified in paragraphs (ii) and (iii) of this subsection] for sources that are including emission points in an emissions average. Emission standards established under this section may specify alternative dates for the submittal of requests for an extension of compliance if alternatives are appropriate for the source categories affected by those standards, e.g., a compliance date specified by the standard is less than 12 (or 18) months after the standard's effective date.

(II) The owner or operator of an existing source unable to comply with a relevant standard established under this section pursuant to section 112(f)

of the Act may request that the Administrator grant an extension allowing the source up to 2 years after the standard's effective date to comply with the standard. The Administrator may grant such an extension if it is determined that such additional period is necessary for the installation of controls and that steps will be taken during the period of the extension to assure that the health of persons will be protected from imminent endangerment. Any request for an extension of compliance with a relevant standard under this paragraph shall be submitted in writing to the Administrator not later than 15 calendar days after the effective date of the relevant standard.

(E) The owner or operator of an existing source that has installed BACT or technology required to meet LAER [as specified in paragraph (viii)(B)(II) of this subsection] prior to the promulgation of a relevant emission standard may request that the Administrator grant an extension allowing the source 5 years from the date on which such installation was achieved, as determined by the Administrator, to comply with the standard. Any request for an extension of compliance with a relevant standard under this paragraph shall be submitted in writing to the Administrator not later than 120 days after the promulgation date of the standard. The Administrator may grant such an extension if it is determined that the installation of BACT or technology to meet LAER controls the same pollutant (or stream of pollutants) that would be controlled at that source by the relevant emission standard.

(F) (I) The request for a compliance extension under paragraph (viii)(D) of this subsection shall include the following information:

(1.) A description of the controls to be installed to comply with the standard;

(2.) A compliance schedule, including the date by which each step toward compliance will be reached. At a minimum, the list of dates shall include:

a. The date by which contracts for emission control systems or process changes for emission control will be awarded, or the date by which orders will be issued for the purchase of component parts to accomplish emission control or process changes;

b. The date by which on-site construction, installation of emission control equipment, or a process change is to be initiated;

c. The date by which on-site construction, installation of emission control equipment, or a process change is to be completed; and

d. The date by which final compliance is to be achieved;

(3.) A description of interim emission control steps that will be taken during the extension period, including milestones to assure proper operation and maintenance of emission control and process equipment; and

(4.) Whether the owner or operator is also requesting an extension of other applicable requirements (e.g., performance testing requirements).

(II) The request for a compliance extension under paragraph (viii)(E) of this subsection shall include all information needed to demonstrate to the Administrator's satisfaction that the installation of BACT or technology to meet LAER controls the same pollutant (or stream of pollutants) that would be controlled at that source by the relevant emission standard.

(G) Advice on requesting an extension of compliance may be obtained from the Administrator.

(H) Approval of Request for Extension of Compliance. Paragraphs (viii)(I) through (viii)(N) of this subsection concern approval of an extension of compliance requested under paragraphs (viii)(D) through (viii)(F) of this subsection.

(I) Based on the information provided in any request made under paragraphs (viii)(D) through (viii)(F) of this subsection, or other information, the Administrator may grant an extension of compliance with an emission standard, as specified in paragraphs (viii)(D) and (viii)(E) of this subsection.

(J) The extension will be in writing and will:

(I) Identify each affected source covered by the extension;

(II) Specify the termination date of the extension;

(III) Specify the dates by which steps toward compliance are to be taken, if appropriate;

(IV) Specify other applicable requirements to which the compliance extension applies (e.g., performance tests); and

(V) (1.) Under paragraph (viii)(D), specify any additional conditions that the Administrator deems necessary to assure installation of the necessary controls and protection of the health of persons during the extension period; or

(2.) Under paragraph (viii)(E), specify any additional conditions that the Administrator deems necessary to assure the proper operation and maintenance of the installed controls during the extension period.

(K) The owner or operator of an existing source that has been granted an extension of compliance under paragraph (viii)(J) of this subsection may be required to submit to the Administrator progress reports indicating whether the steps toward compliance outlined in the compliance schedule have been reached. The contents of the progress reports and the dates by which they shall be submitted will be specified in the written extension of compliance granted under paragraph (viii)(J) of this subsection.

(L) (I) The Administrator will notify the owner or operator in writing of approval or intention to deny approval of a request for an extension of compliance within 30 calendar days after receipt of sufficient information to evaluate a request submitted under paragraph (viii)(D)(I) or (viii)(E) of this subsection. The 30-day approval or denial period will begin after the owner or operator has been notified in writing that the application is complete. The Administrator will notify the owner or operator in writing of the status of the application, that is, whether the application contains sufficient information to make a determination, within 30 calendar days after receipt of the original application and within 30 calendar days after receipt of any supplementary information that is submitted.

(II) When notifying the owner or operator that the application is not complete, the Administrator will specify the information needed to complete the application and provide notice of opportunity for the applicant to present, in writing, within 30 calendar days after notification of the incomplete application, additional information or arguments to the Administrator to enable further action on the application.

(III) Before denying any request for an extension of compliance, the Administrator will notify the owner or operator in writing of the Administrator's intention to issue the denial, together with:

(1.) Notice of the information and findings on which the intended denial is based; and

(2.) Notice of opportunity for the owner or operator to present in writing, within 15 calendar days after notification of the intended denial, additional information or arguments to the Administrator before further action on the request.

(IV) The Administrator's final determination to deny any request for an extension will be in writing and will set forth the specific grounds on which the denial is based. The final determination will be made within 30 calendar days after presentation of additional information or argument (if the application is complete), or within 30 calendar days after the final date specified for the presentation if no presentation is made.

(M) (I) The Administrator will notify the owner or operator in writing of approval or intention to deny approval of a request for an extension of compliance within 30 calendar days after receipt of sufficient information to evaluate a request submitted under paragraph (viii)(D)(II) of this section. The 30-day approval or denial period will begin after the owner or operator has been notified in writing that the application is complete. The Administrator will notify the owner or operator in writing of the status of the application, that is, whether the application contains sufficient information to make a determination, within 15 calendar days after receipt of the original application and within 15 calendar days after receipt of any supplementary information that is submitted.

(II) When notifying the owner or operator that the application is not complete, the Administrator will specify the information needed to complete the application and provide notice of opportunity for the applicant to present, in writing, within 15 calendar days after notification of the incomplete application, additional information or arguments to the Administrator to enable further action on the application.

(III) Before denying any request for an extension of compliance, the Administrator will notify the owner or operator in writing of the Administrator's intention to issue the denial, together with:

(1.) Notice of the information and findings on which the intended denial is based; and

(2.) Notice of opportunity for the owner or operator to present in writing, within 15 calendar days after notification of the intended denial, additional information or arguments to the Administrator before further action on the request.

(IV) A final determination to deny any request for an extension will be in writing and will set forth the specific ground on which the denial is based. The final determination will be made within 30 calendar days after presentation of additional information or argument (if the application is complete), or within 30 calendar days after the final date specified for the presentation if no presentation is made.

(N) The Administrator may terminate an extension of compliance at an earlier date than specified if any specification under paragraph (viii)(J)(III) or (viii)(J)(IV) of this subsection is not met.

(O) The granting of an extension under this section shall not abrogate the Administrator's authority under §35-11-110 of the Wyoming Environmental Quality Act.

(ix) Exemption From Compliance With Emission Standards.

The President may exempt any stationary source from compliance with any relevant standard established pursuant to section 112 of the Act for a period of not more than 2 years if the President determines that the technology to implement such standard is not available and that it is in the national security interests of the United States to do so. An exemption under this paragraph may be extended for 1 or more additional periods, each period not to exceed 2 years.

(i) Performance Testing Requirements.

(i) Applicability and Performance Test Dates.

(A) Unless otherwise specified, this subsection applies to the owner or operator of an affected source required to do performance testing, or another form of compliance demonstration, under a relevant standard.

(B) If required to do performance testing by a relevant standard, and unless a waiver of performance testing is obtained under this subsection or the conditions of paragraph (iii)(C)(II)(2.) of this subsection apply, the owner or operator of the affected source shall perform such tests as follows:

(I) Within 180 days after the effective date of a relevant standard for a new source that has an initial startup date before the effective date; or

(II) Within the requirements of Chapter 6, Section 2 after initial startup for a new source that has an initial startup date after the effective date of a relevant standard; or

(III) Within 180 days after the compliance date specified in an applicable subpart of this section for an existing source subject to an emission standard established pursuant to section 112(d) of the Act, or within 180 days after startup of an existing source if the source begins operation after the effective date of the relevant emission standard; or

(IV) Within 180 days after the compliance date for an existing source subject to an emission standard established pursuant to section 112(f) of the Act; or

(V) Within 180 days after the termination date of the source's extension of compliance for an existing source that obtains an extension of compliance under subsection (i)(viii); or

(VI) Within the requirements of Chapter 6, Section 2 after the compliance date for a new source, subject to an emission standard established pursuant to section 112(f) of the Act, for which construction or reconstruction is

commenced after the proposal date of a relevant standard established pursuant to section 112(d) of the Act but before the proposal date of the relevant standard established pursuant to section 112(f) [see subsection (i)(ii)(D)]; or

(VII) When an emission standard promulgated under this section is more stringent than the standard proposed [see subsection (i)(ii)(C)], the owner or operator of a new or reconstructed source subject to that standard for which construction or reconstruction is commenced between the proposal and promulgation dates of the standard shall comply with performance testing requirements within 180 days after the standard's effective date, or within 180 days after startup of the source, whichever is later. If the promulgated standard is more stringent than the proposed standard, the owner or operator may choose to demonstrate compliance with either the proposed or the promulgated standard. If the owner or operator chooses to comply with the proposed standard initially, the owner or operator shall conduct a second performance test within 3 years and 180 days after the effective date of the standard, or after startup of the source, whichever is later, to demonstrate compliance with the promulgated standard.

(C) The Administrator may require an owner or operator to conduct performance tests at the affected source at any other time when the action is authorized by §35-11-110 of the Wyoming Environmental Quality Act.

(ii) Notification of Performance Test.

(A) The owner or operator of an affected source shall notify the Administrator in writing of his or her intention to conduct a performance test at least 60 calendar days before the performance test is scheduled to begin to allow the Administrator, upon request, to review and approve the site-specific test plan required under paragraph (iii) of this subsection and to have an observer present during the test. Observation of the performance test by the Administrator is optional.

(B) In the event the owner or operator is unable to conduct the performance test on the date specified in the notification requirement specified in paragraph (ii)(A) of this subsection, due to unforeseeable circumstances beyond his or her control, the owner or operator shall notify the Administrator within 5 days prior to the scheduled performance test date and specify the date when the performance test is rescheduled. This notification of delay in conducting the performance test shall not relieve the owner or operator of legal responsibility for compliance with any other applicable provisions of this section or with any other applicable Federal, State, or local requirement, nor will it prevent the Administrator from implementing or enforcing this section or taking any other action under the Wyoming Environmental Quality Act.

(iii) Quality Assurance Program.

(A) The results of the quality assurance program required in this paragraph will be considered by the Administrator when determining the validity of a

performance test.

(B) (I) Submission of Site-Specific Test Plan. Before conducting a required performance test, the owner or operator of an affected source shall develop and, if requested by the Administrator, shall submit a site-specific test plan to the Administrator for approval. The test plan shall include a test program summary, the test schedule, data quality objectives, and both an internal and external quality assurance (QA) program. Data quality objectives are the pretest expectations of precision, accuracy, and completeness of data.

(II) The internal QA program shall include, at a minimum, the activities planned by routine operators and analysts to provide an assessment of test data precision; an example of internal QA is the sampling and analysis of replicate samples.

(III) The external QA program shall include, at a minimum, application of plans for a test method performance audit (PA) during the performance test. The PA's consist of blind audit samples provided by the Administrator and analyzed during the performance test in order to provide a measure of test data bias. The external QA program may also include systems audits that include the opportunity for on-site evaluation by the Administrator of instrument calibration, data validation, sample logging, and documentation of quality control data and field maintenance activities.

(IV) The owner or operator of an affected source shall submit the site-specific test plan to the Administrator upon the Administrator's request at least 60 calendar days before the performance test is scheduled to take place, that is, simultaneously with the notification of intention to conduct a performance test required under paragraph (ii) of this subsection, or on a mutually agreed upon date.

(V) The Administrator may request additional relevant information after the submittal of a site-specific test plan.

(C) Approval of Site-Specific Test Plan.

(I) The Administrator will notify the owner or operator of approval or intention to deny approval of the site-specific test plan (if review of the site-specific test plan is requested) within 30 calendar days after receipt of the original plan and within 30 calendar days after receipt of any supplementary information that is submitted under paragraph (iii)(C)(I)(2.) of this subsection. Before disapproving any site-specific test plan, the Administrator will notify the applicant of the Administrator's intent to disapprove the plan together with:

(1.) Notice of the information and findings on which the intended disapproval is based; and

(2.) Notice of opportunity for the owner or operator to present, within 30 calendar days after notification of the intended disapproval, additional information to the Administrator before final action on the plan.

(II) In the event that the Administrator fails to approve or disapprove the site-specific test plan within the time period specified in paragraph (iii)(C)(I) of this subsection, the following conditions shall apply:

(1.) If the owner or operator intends to demonstrate compliance using the test method(s) specified in the relevant standard, the owner or operator shall conduct the performance test within the time specified in this subsection using the specified method(s);

(2.) If the owner or operator intends to demonstrate compliance by using an alternative to any test method specified in the relevant standard, the owner or operator shall refrain from conducting the performance test until the Administrator approves the use of the alternative method when the Administrator approves the site-specific test plan (if review of the site-specific test plan is requested) or until after the alternative method is approved [see paragraph (vi) of this subsection]. If the Administrator does not approve the site-specific test plan (if review is requested) or the use of the alternative method within 30 days before the test is scheduled to begin, the performance test dates specified in paragraph (i) of this subsection may be extended such that the owner or operator shall conduct the performance test within 60 calendar days after the Administrator approves the site-specific test plan or after use of the alternative method is approved. Notwithstanding the requirements in the preceding two sentences, the owner or operator may proceed to conduct the performance test as required in this subsection (without the Administrator's prior approval of the site-specific test plan) if it is subsequently chosen to use the specified testing and monitoring methods instead of an alternative.

(III) Neither the submission of a site-specific test plan for approval, nor the Administrator's approval or disapproval of a plan, nor the Administrator's failure to approve or disapprove a plan in a timely manner shall:

(1.) Relieve an owner or operator of legal responsibility for compliance with an applicable provisions of this section or with any other applicable Federal, State, or local requirement; or

(2.) Prevent the Administrator from implementing or enforcing this section or taking any other action under the Wyoming Environmental Quality Act.

(D) (I) Performance Test Method Audit Program. The owner or operator shall analyze performance audit (PA) samples during each performance test.

The owner or operator shall request performance audit materials 45 days prior to the test date. Cylinder audit gases may be obtained by contacting the Administrator.

(II) The Administrator will have sole discretion to require any subsequent remedial actions of the owner or operator based on the PA results.

(III) If the Administrator fails to provide required PA materials to an owner or operator of an affected source in time to analyze the PA samples during a performance test, the requirement to conduct a PA under this paragraph shall be waived for such source for that performance test. Waiver under this paragraph of the requirement to conduct a PA for a particular performance test does not constitute a waiver of the requirement to conduct a PA for future required performance tests.

(iv) Performance Testing Facilities. If required to do performance testing, the owner or operator of each new source and, at the request of the Administrator, the owner or operator of each existing source, shall provide performance testing facilities as follows:

(A) Sampling ports adequate for test methods applicable to such source. This includes:

(I) Constructing the air pollution control system such that volumetric flow rates and pollutant emission rates can be accurately determined by applicable test methods and procedures; and

(II) Providing a stack or duct free of cyclonic flow during performance tests, as demonstrated by applicable test methods and procedures;

(B) Safe sampling platform(s);

(C) Safe access to sampling platform(s);

(D) Utilities for sampling and testing equipment; and

(E) Any other facilities that the Administrator deems necessary for safe and adequate testing of a source.

(v) Conduct of Performance Tests.

(A) Performance tests shall be conducted under such conditions as the Administrator specifies to the owner or operator based on representative performance (i.e., performance based on normal operating conditions) of the affected source. Operations during periods of startup, shutdown, and malfunction shall not constitute representative conditions for the purpose of a performance test, nor shall emissions in excess of the level of the relevant standard during periods of startup, shutdown, and

malfunction be considered a violation of the relevant standard unless otherwise specified in the relevant standard or a determination of noncompliance is made under subsection (h)(iv). Upon request, the owner or operator shall make available to the Administrator such records as may be necessary to determine the conditions of performance tests.

(B) Performance tests shall be conducted and data shall be reduced in accordance with the test methods and procedures set forth in this subsection, in each relevant standard, and, if required, in applicable appendices, unless the Administrator:

(I) Specifies or approves, in specific cases, the use of a test method with minor changes in methodology; or

(II) Approves the use of an alternative test method, the results of which the Administrator has determined to be adequate for indicating whether a specific affected source is in compliance; or

(III) Approves shorter sampling times and smaller sample volumes when necessitated by process variables or other factors; or

(IV) Waives the requirement for performance tests because the owner or operator of an affected source has demonstrated by other means to the Administrator's satisfaction that the affected source is in compliance with the relevant standard.

(C) Unless otherwise specified in a relevant standard or test method, each performance test shall consist of three separate runs using the applicable test method. Each run shall be conducted for the time and under the conditions specified in the relevant standard. For the purpose of determining compliance with a relevant standard, the arithmetic mean of the results of the three runs shall apply. Upon receiving approval from the Administrator, results of a test run may be replaced with results of an additional test run in the event that:

(I) A sample is accidentally lost after the testing team leaves the site; or

(II) Conditions occur in which one of the three runs must be discontinued because of forced shutdown; or

(III) Extreme meteorological conditions occur; or

(IV) Other circumstances occur that are beyond the owner or operator's control.

(D) Nothing in paragraphs (v)(A) through (v)(C) of this subsection shall be construed to abrogate the Administrator's authority to require testing under §35-11-110 of the Wyoming Environmental Quality Act.

(vi) Use of an Alternative Test Method.

(A) General. Until permission to use an alternative test method has been granted by the Administrator under this paragraph, the owner or operator of an affected source remains subject to the requirements of this subsection and the relevant standard.

(B) The owner or operator of an affected source required to do performance testing by a relevant standard may use an alternative test method from that specified in the standard provided that the owner or operator:

(I) Notifies the Administrator of the intention to use an alternative test method not later than with the submittal of the site-specific test plan (if requested by the Administrator) or at least 60 days before the performance test is scheduled to begin if a site-specific test plan is not submitted;

(II) Uses Method 301 in 40 CFR part 63, Appendix A to validate the alternative test method; and

(III) Submits the results of the Method 301 validation process along with the notification of intention and the justification for not using the specified test method. The owner or operator may submit the information required in this paragraph well in advance of the deadline specified in paragraph (vi)(B)(I) of this subsection to ensure a timely review by the Administrator in order to meet the performance test date specified in this subsection or the relevant standard.

(C) The Administrator will determine whether the owner or operator's validation of the proposed alternative test method is adequate when the Administrator approves or disapproves the site-specific test plan required under paragraph (iii) of this subsection. If the Administrator finds reasonable grounds to dispute the results obtained by the Method 301 validation process, the Administrator may require the use of a test method specified in a relevant standard.

(D) If the Administrator finds reasonable grounds to dispute the results obtained by an alternative test method for the purposes of demonstrating compliance with a relevant standard, the Administrator may require the use of a test method specified in a relevant standard.

(E) If the owner or operator uses an alternative test method for an affected source during a required performance test, the owner or operator of such source shall continue to use the alternative test method for subsequent performance tests at that

affected source until approval is received from the Administrator to use another test method as allowed under subsection (i)(vi).

(F) Neither the validation and approval process nor the failure to validate an alternative test method shall abrogate the owner or operator's responsibility to comply with the requirements of this section.

(vii) Data Analysis, Recordkeeping, and Reporting.

(A) Unless otherwise specified in a relevant standard or test method, or as otherwise approved by the Administrator in writing, results of a performance test shall include the analysis of samples, determination of emissions, and raw data. A performance test is "completed" when field sample collection is terminated. The owner or operator of an affected source shall report the results of the performance test to the Administrator before the close of business on the 60th day following the completion of the performance test, unless specified otherwise in a relevant standard or as approved otherwise in writing by the Administrator [see subsection (k)(ix)]. The results of the performance test shall be submitted as part of the notification of compliance status required under subsection (k)(viii).

(B) For a minimum of 5 years after a performance test is conducted, the owner or operator shall retain and make available, upon request, for inspection by the Administrator the records or results of such performance test and other data needed to determine emissions from an affected source.

(viii) Waiver of Performance Tests.

(A) Until a waiver of a performance testing requirement has been granted by the Administrator under this paragraph, the owner or operator of an affected source remains subject to the requirements of this subsection.

(B) Individual performance tests may be waived upon written application to the Administrator if, in the Administrator's judgment, the source is meeting the relevant standards(s) on a continuous basis, or the source is being operated under an extension of compliance, or the owner or operator has requested an extension of compliance and the Administrator is still considering that request.

(C) Request to Waive a Performance Test.

(I) If a request is made for an extension of compliance under subsection (h)(viii), the application for a waiver of an initial performance test shall accompany the information required for the request for an extension of compliance. If no extension of compliance is requested or if the owner or operator has requested an extension of compliance and the Administrator is still considering that request, the application for a waiver of an initial performance test shall be submitted at least 60 days

before the performance test if the site-specific test plan under paragraph (iii) of this section is not submitted.

(II) If an application for a waiver of a subsequent performance test is made, the application may accompany any required compliance progress report, compliance status report, or excess emissions and continuous monitoring system performance report [such as those required under subsection (h)(viii), subsection (k)(viii), and subsection (l)(v) or specified in a relevant standard or in the source's operating permit], but it shall be submitted at least 60 days before the performance test if the site-specific test plan required under paragraph (iii) of this subsection is not submitted.

(III) Any application for a waiver of a performance test shall include information justifying the owner or operator's request for a waiver, such as the technical or economic infeasibility, or the impracticality, of the affected source performing the required test.

(D) Approval of Request to Waive Performance Test. The Administrator will approve or deny a request for a waiver of a performance test made under paragraph (viii)(C) of this subsection when the Administrator:

(I) Approves or denies an extension of compliance under subsection (h)(viii)(H); or

(II) Approves or disapproves a site-specific test plan under subsection (i)(iii)(C); or

(III) Makes a determination of compliance following the submission of a required compliance status report or excess emissions and continuous monitoring systems performance report; or

(IV) Makes a determination of suitable progress towards compliance following the submission of a compliance progress report, whichever is applicable.

(E) Approval of any waiver granted under this subsection shall not abrogate the Administrator's authority under the Wyoming Environmental Quality Act or in any way prohibit the Administrator from later canceling the waiver. The cancellation will be made only after notice is given to the owner or operator of the affected source.

(j) Monitoring Requirements.

(i) Applicability.

(A) (I) Unless otherwise specified in a relevant standard, this subsection applies to the owner or operator of an affected source required to do monitoring under that standard.

(II) Relevant standards established under this section will specify monitoring systems, methods, or procedures, monitoring frequency, and other pertinent requirements for source(s) regulated by those standards. This section specifies general monitoring requirements such as those governing the conduct of monitoring and requests to use alternative monitoring methods. In addition, this subsection specifies detailed requirements that apply to affected sources required to use continuous monitoring systems (CMS) under a relevant standard.

(B) For the purposes of this section, all CMS required under relevant standards shall be subject to the provisions of this subsection upon promulgation of performance specifications for CMS as specified in the relevant standard or otherwise by the Administrator.

(C) Additional monitoring requirements for control devices used to comply with provisions in relevant standards of this section are specified in subsection (m).

(ii) Conduct of Monitoring.

(A) Monitoring shall be conducted as set forth in this subsection and the relevant standard(s) unless the Administrator:

(I) Specifies or approves the use of minor changes in methodology for the specified monitoring requirements and procedures; or

(II) Approves the use of alternatives to any monitoring requirements or procedures.

(III) Owners or operators with flares subject to subsection (m)(ii) are not subject to the requirements of this subsection unless otherwise specified in the relevant standard.

(B) (I) When the effluents from a single affected source, or from two or more affected sources, are combined before being released to the atmosphere, the owner or operator shall install an applicable CMS on each effluent.

(II) If the relevant standard is a mass emission standard and the effluent from one affected source is released to the atmosphere through more than one point, the owner or operator shall install an applicable CMS at each emission point unless the installation of fewer systems is:

(1.) Approved by the Administrator; or

(2.) Provided for in a relevant standard (e.g., instead of requiring that a CMS be installed at each emission point before the effluents from those points are channeled to a common control device, the standard specifies that only one CMS is required to be installed at the vent of the control device).

(C) When more than one CMS is used to measure the emissions from one affected source (e.g., multiple breechings, multiple outlets), the owner or operator shall report the results as required for each CMS. However, when one CMS is used as a backup to another CMS, the owner or operator shall report the results from the CMS used to meet the monitoring requirements of this section. If both such CMS are used during a particular reporting period to meet the monitoring requirements of this section, then the owner or operator shall report the results from each CMS for the relevant compliance period.

(iii) Operation and Maintenance of Continuous Monitoring Systems.

(A) The owner or operator of an affected source shall maintain and operate each CMS as specified in this subsection, or in a relevant standard, and in a manner consistent with good air pollution control practices.

(I) The owner or operator of an affected source shall ensure the immediate repair or replacement of CMS parts to correct “routine” or otherwise predictable CMS malfunctions as defined in the source’s startup, shutdown, and malfunction plan required by subsection (h)(iv)(C). The owner or operator shall keep the necessary parts for routine repairs of the affected equipment readily available. If the plan is followed and the CMS repaired immediately, this action shall be reported in the semiannual startup, shutdown, and malfunction report required under subsection (l)(iv)(E)(I).

(II) For those malfunctions or other events that affect the CMS and are not addressed by the startup, shutdown, and malfunction plan, the owner or operator shall report actions that are not consistent with the startup, shutdown, and malfunction plan within 24 hours after commencing actions inconsistent with the plan. The owner or operator shall send a follow-up report within 2 weeks after commencing actions inconsistent with the plan that either certifies that corrections have been made or includes a corrective action plan and schedule. The owner or operator shall provide proof that repair parts have been ordered or any other records that would indicate that the delay in making repairs is beyond their control.

(III) The Administrator’s determination of whether acceptable operation and maintenance procedures are being used will be based on information that may include, but is not limited to, review of operation and maintenance procedures, operation and maintenance records, manufacturing recommendations and

specifications, and inspection of the CMS. Operation and maintenance procedures written by the CMS manufacturer and other guidance also can be used to maintain and operate each CMS.

(B) All CMS shall be installed such that representative measurements of emissions or process parameters from the affected source are obtained. In addition, CEMS shall be located according to procedures contained in the applicable performance specification(s).

(C) All CMS shall be installed, operational, and the data verified as specified in the relevant standard either prior to or in conjunction with conducting performance tests under subsection (i). Verification of operational status shall, at a minimum, include completion of the manufacturer's written specifications or recommendations for installation, operation, and calibration of the system.

(D) Except for system breakdowns, out-of-control periods, repairs, maintenance periods, calibration checks, and zero (low-level) and high-level calibration drift adjustments, all CMS, including COMS and CEMS, shall be in continuous operation and shall meet minimum frequency of operation requirements as follows:

(I) All COMS shall complete a minimum of one cycle of sampling and analyzing for each successive 10-second period and one cycle of data recording for each successive 6-minute period.

(II) All CEMS for measuring emissions other than opacity shall complete a minimum of one cycle of operation (sampling, analyzing, and data recording) for each successive 15-minute period.

(E) Unless otherwise approved by the Administrator, minimum procedures for COMS shall include a method for producing a simulated zero opacity condition and an upscale (high-level) opacity condition using a certified neutral density filter or other related technique to produce a known obscuration of the light beam. Such procedures shall provide a system check of all the analyzer's internal optical surfaces and all electronic circuitry, including the lamp and photodetector assembly normally used in the measurement of opacity.

(F) The owner or operator of a CMS installed in accordance with the provisions of this section and the applicable CMS performance specification(s) shall check the zero (low-level) and high-level calibration drifts at least once daily in accordance with the written procedure specified in the performance evaluation plan developed under paragraphs (v)(C)(I) and (v)(C)(II) of this subsection. The zero (low-level) and high-level calibration drifts shall be adjusted, at a minimum, whenever the 24-hour zero (low-level) drift exceeds two times the limits of the applicable performance specification(s) specified in the relevant standard. The system must allow the amount of excess zero (low-level) and high-level drift measured at the 24-hour interval checks to be

recorded and quantified, whenever specified. For COMS, all optical and instrumental surfaces exposed to the effluent gases shall be cleaned prior to performing the zero (low-level) and high-level drift adjustments; the optical surfaces and instrumental surfaces shall be cleaned when the cumulative automatic zero compensation, if applicable, exceeds 4 percent opacity.

(G) (I) A CMS is out of control if:

(1.) The zero (low-level), mid-level (if applicable), or high-level calibration drift (CD) exceeds two times the applicable CD specification in the applicable performance specification or in the relevant standard; or

(2.) The CMS fails a performance test audit (e.g., cylinder gas audit), relative accuracy audit, relative accuracy test audit, or linearity test audit; or

(3.) The COMS CD exceeds two times the limit in the applicable performance specification in the relevant standard.

(II) When the CMS is out of control, the owner or operator of the affected source shall take the necessary corrective action and shall repeat all necessary tests which indicate that the system is out of control. The owner or operator shall take corrective action and conduct retesting until the performance requirements are below the applicable limits. The beginning of the out-of-control period is the hour the owner or operator conducts a performance check (e.g., calibration drift) that indicates an exceedance of the performance requirements established under this section. The end of the out-of-control period is the hour following the completion of corrective action and successful demonstration that the system is within the allowable limits. During the period the CMS is out of control, recorded data shall not be used in data averages and calculations, or to meet any data availability requirement established under this section.

(H) The owner or operator of a CMS that is out of control as defined in paragraph (iii)(G) of this subsection shall submit all information concerning out-of-control periods, including start and end dates and hours and descriptions of corrective actions taken, in the excess emissions and continuous monitoring system performance report required in subsection (I)(v)(C).

(iv) Quality Control Program.

(A) The results of the quality control program required in this paragraph will be considered by the Administrator when determining the validity of monitoring data.

(B) The owner or operator of an affected source that is required to use a CMS and is subject to the monitoring requirements of this subsection and a relevant

standard shall develop and implement a CMS quality control program. As part of the quality control program, the owner or operator shall develop and submit to the Administrator for approval upon request a site-specific performance evaluation test plan for the CMS performance evaluation required in paragraph (v)(C)(I) of this subsection, according to the procedures specified in paragraph (v). In addition, each quality control program shall include, at a minimum, a written protocol that describes procedures for each of the following operations:

- (I) Initial and any subsequent calibration of the CMS;
- (II) Determination and adjustment of the calibration drift of the CMS;
- (III) Preventive maintenance of the CMS, including spare parts inventory;
- (IV) Data recording, calculations, and reporting;
- (V) Accuracy audit procedures, including sampling and analysis methods; and
- (VI) Program of corrective action for a malfunctioning CMS.

(C) The owner or operator shall keep these written procedures on record for the life of the affected source or until the affected source is no longer subject to the provisions of this section, to be made available for inspection, upon request, by the Administrator. If the performance evaluation plan is revised, the owner or operator shall keep previous (i.e., superseded) versions of the performance evaluation plan on record to be made available for inspection, upon request, by the Administrator, for a period of 5 years after each revision to the plan. Where relevant, e.g., program of corrective action for a malfunctioning CMS, these written procedures may be incorporated as part of the affected source's startup, shutdown, and malfunction plan to avoid duplication of planning and recordkeeping efforts.

(v) Performance Evaluation of Continuous Monitoring Systems.

(A) General. When required by a relevant standard, and at any other time the Administrator may require under §35-11-110 of the Wyoming Environmental Quality Act, the owner or operator of an affected source being monitored shall conduct a performance evaluation of the CMS. Such performance evaluation shall be conducted according to the applicable specifications and procedures described in this subsection or in the relevant standard.

(B) Notification of Performance Evaluation. The owner or operator shall notify the Administrator in writing of the date of the performance evaluation simultaneously with the notification of the performance test date required under subsection (i)(ii) or at least 60 days prior to the date the performance evaluation is scheduled to begin if no performance test is required.

(C) (I) Submission of Site-Specific Performance Evaluation Test Plan. Before conducting a required CMS performance evaluation, the owner or operator of an affected source shall develop and submit a site-specific performance evaluation test plan to the Administrator for approval upon request. The performance evaluation test plan shall include the evaluation program objectives, an evaluation program summary, the performance evaluation schedule, data quality objectives, and both an internal and external QA program. Data quality objectives are the pre-evaluation expectations of precision, accuracy, and completeness of data.

(II) The internal QA program shall include, at a minimum, the activities planned by routine operators and analysts to provide an assessment of CMS performance. The external QA program shall include, at a minimum, systems audits that include the opportunity for on-site evaluation by the Administrator of instrument calibration, data validation, sample logging, and documentation of quality control data and field maintenance activities.

(III) The owner or operator of an affected source shall submit the site-specific performance evaluation test plan to the Administrator (if requested) at least 60 days before the performance test or performance evaluation is scheduled to begin, or on a mutually agreed upon date, and review and approval of the performance evaluation test plan by the Administrator will occur with the review and approval of the site-specific test plan (if review of the site-specific test plan is requested).

(IV) The Administrator may request additional relevant information after the submittal of a site-specific performance evaluation test plan.

(V) In the event that the Administrator fails to approve or disapprove the site-specific performance evaluation test plan within the time period specified in subsection (i)(iii)(C), the following conditions shall apply:

(1.) If the owner or operator intends to demonstrate compliance using the monitoring method(s) specified in the relevant standard, the owner or operator shall conduct the performance evaluation within the time specified in this section using the specified method(s);

(2.) If the owner or operator intends to demonstrate compliance by using an alternative to a monitoring method specified in the relevant standard, the owner or operator shall refrain from conducting the performance evaluation until the Administrator approves the use of the alternative method. If the Administrator

does not approve the use of the alternative method within 30 days before the performance evaluation is scheduled to begin, the performance evaluation deadlines specified in paragraph (v)(D) of this subsection may be extended by the Administrator. The owner or operator may proceed to conduct the performance evaluation as required in this subsection (without the Administrator's prior approval of the site-specific performance evaluation test plan) if it is subsequently chosen to use the specified monitoring method(s) instead of an alternative.

(VI) Neither the submission of a site-specific performance evaluation test plan for approval, nor the Administrator's approval or disapproval of a plan, nor the Administrator's failure to approve or disapprove a plan in a timely manner shall:

(1.) Relieve an owner or operator of legal responsibility for compliance with any applicable provisions of this section or with any other applicable Federal, State, or local requirement; or

(2.) Prevent the Administrator from implementing or enforcing this section or taking any other action under the Wyoming Environmental Quality Act.

(D) Conduct of Performance Evaluation and Performance Evaluation Dates. The owner or operator of an affected source shall conduct a performance evaluation of a required CMS during any performance test required under subsection (i) in accordance with the applicable performance specification as specified in the relevant standard. Notwithstanding the requirement in the previous sentence, if the owner or operator of an affected source elects to submit COMS data for compliance with a relevant opacity emission standard as provided under subsection (h)(vii)(F), a performance evaluation of the COMS shall be conducted as specified in the relevant standard, before the performance test required under subsection (i) is conducted in time to submit the results of the performance evaluation as specified in paragraph (v)(E)(II) of this subsection. If a performance test is not required, or the requirement for a performance test has been waived under subsection (i)(viii), the owner or operator of an affected source shall conduct the performance evaluation not later than 180 days after the appropriate compliance date for the affected source, as specified in subsection (i), or as otherwise specified in the relevant standard.

(E) Reporting Performance Evaluation Results.

(I) The owner or operator shall furnish the Administrator a copy of a written report of the results of the performance evaluation simultaneously with the results of the performance test required under subsection (i) or within 60 days of completion of the performance evaluation if no test is required, unless otherwise specified in a relevant standard. The Administrator may request that the owner or operator submit

the raw data from a performance evaluation in the report of the performance evaluation results.

(II) The owner or operator of an affected source using a COMS to determine opacity compliance during any performance test required under subsection (i) and described in subsection (h)(vii)(F) shall furnish the Administrator two or, upon request, three copies of a written report of the results of the COMS performance evaluation under this paragraph. The copies shall be provided at least 15 calendar days before the performance test required under subsection (i) is conducted.

(vi) Use of an Alternative Monitoring Method.

(A) General. Until permission to use an alternative monitoring method has been granted by the Administrator under this paragraph, the owner or operator of an affected source remains subject to the requirements of this subsection and the relevant standard.

(B) After receipt and consideration of written application, the Administrator may approve alternatives to any monitoring methods or procedures of this section including, but not limited to, the following:

(I) Alternative monitoring requirements when installation of a CMS specified by a relevant standard would not provide accurate measurements due to liquid water or other interferences caused by substances within the effluent gases;

(II) Alternative monitoring requirements when the affected source is infrequently operated;

(III) Alternative monitoring requirements to accommodate CEMS that require additional measurements to correct for stack moisture conditions;

(IV) Alternative locations for installing CMS when the owner or operator can demonstrate that installation at alternate locations will enable accurate and representative measurements;

(V) Alternate methods for converting pollutant concentration measurements to units of the relevant standard;

(VI) Alternate procedures for performing daily checks of zero (low-level) and high-level drift that do not involve use of high-level gases or test cells;

(VII) Alternatives to the American Society for Testing and Materials (ASTM) test methods or sampling procedures specified by any relevant standard;

(VIII) Alternative CMS that do not meet the design or performance requirements in this section, but adequately demonstrate a definite and consistent relationship between their measurements and the measurements of opacity by a system complying with the requirements as specified in the relevant standard. The Administrator may require that such demonstration be performed for each affected source; or

(IX) Alternative monitoring requirements when the effluent from a single affected source or the combined effluent from two or more affected sources is released to the atmosphere through more than one point.

(C) If the Administrator finds reasonable grounds to dispute the results obtained by an alternative monitoring method, requirement, or procedure, the Administrator may require the use of a method, requirement, or procedure specified in this subsection or in the relevant standard. If the results of the specified and alternative method, requirement, or procedure do not agree, the results obtained by the specified method, requirement, or procedure shall prevail.

(D) (I) Request to Use Alternative Monitoring Method. An owner or operator who wishes to use an alternative monitoring method shall submit an application to the Administrator as described in paragraph (vi)(D)(II) of this subsection, below. The application may be submitted at any time provided that the monitoring method is not used to demonstrate compliance with a relevant standard or other requirement. If the alternative monitoring method is to be used to demonstrate compliance with a relevant standard, the application shall be submitted not later than with the site-specific test plan required in subsection (i)(iii) (if requested) or with the site-specific performance evaluation plan (if requested) or at least 60 days before the performance evaluation is scheduled to begin.

(II) The application shall contain a description of the proposed alternative monitoring system and a performance evaluation test plan, if required, as specified in paragraph (v)(C) of this subsection. In addition, the application shall include information justifying the owner or operator's request for an alternative monitoring method, such as the technical or economic infeasibility, or the impracticality, of the affected source using the required method.

(III) The owner or operator may submit the information required in this paragraph well in advance of the submittal dates specified in paragraph (vi)(D)(I) above to ensure a timely review by the Administrator in order to meet the compliance demonstration date specified in this subsection or the relevant standard.

(E) Approval of Request to Use Alternative Monitoring Method.

(I) The Administrator will notify the owner or operator of approval or intention to deny approval of the request to use an alternative monitoring method within 30 calendar days after receipt of the original request and within 30 calendar days after receipt of any supplementary information that is submitted. Before disapproving any request to use an alternative monitoring method, the Administrator will notify the applicant of the Administrator's intention to disapprove the request together with:

(1.) Notice of the information and findings on which the intended disapproval is based; and

(2.) Notice of opportunity for the owner or operator to present additional information to the Administrator before final action on the request. At the time the Administrator notifies the applicant of the intention to disapprove the request, the Administrator will specify how much time the owner or operator will have after being notified of the intended disapproval to submit the additional information.

(II) The Administrator may establish general procedures and criteria in a relevant standard to accomplish the requirements of paragraph (vi)(E)(I) of this subsection.

(III) If the Administrator approves the use of an alternative monitoring method for an affected source under paragraph (vi)(E)(I) of this subsection, the owner or operator of such source shall continue to use the alternative monitoring method until approval is received from the Administrator to use another monitoring method as allowed by subsection (j)(vi).

(F) Alternative to the Relative Accuracy Test. An alternative to the relative accuracy test for CEMS specified in a relevant standard may be requested as follows:

(I) Criteria for Approval of Alternative Procedures. An alternative to the test method for determining relative accuracy is available for affected sources with emission rates demonstrated to be less than 50 percent of the relevant standard. The owner or operator of an affected source may petition the Administrator under paragraph (vi)(F)(II) of this subsection to substitute the relative accuracy test in section 7 of Performance Specification 2 with the procedures in section 10 if the results of a performance test conducted according to the requirements in subsection (i), or other tests performed following the criteria in subsection (i), demonstrate that the emission rate of the pollutant of interest in the units of the relevant standard is less than 50 percent of the relevant standard. For affected sources subject to emission limitations expressed as control efficiency levels, the owner or operator may petition the Administrator to substitute the relative accuracy test with the procedures in section 10 of Performance Specification 2 if the control device exhaust emission rate is less than 50 percent of the level needed to meet the control efficiency requirement. The alternative procedures do

not apply if the CEMS is used continuously to determine compliance with the relevant standard.

(II) Petition to Use Alternative to Relative Accuracy Test.

The petition to use an alternative to the relative accuracy test shall include a detailed description of the procedures to be applied, the location and the procedure for conducting the alternative, the concentration or response levels of the alternative relative accuracy materials, and the other equipment checks included in the alternative procedure(s). The Administrator will review the petition for completeness and applicability. The Administrator's determination to approve an alternative will depend on the intended use of the CEMS data and may require specifications more stringent than in Performance Specification 2.

(III) Rescission of Approval to Use Alternative to Relative Accuracy Test. The Administrator will review the permission to use an alternative to the CEMS relative accuracy test and may rescind such permission if the CEMS data from a successful completion of the alternative relative accuracy procedure indicate that the affected source's emissions are approaching the level of the relevant standard. The criterion for reviewing the permission is that the collection of CEMS data shows that emissions have exceeded 70 percent of the relevant standard for any averaging period, as specified in the relevant standard. For affected sources subject to emission limitations expressed as control efficiency levels, the criterion for reviewing the permission is that the collection of CEMS data shows that exhaust emissions have exceeded 70 percent of the level needed to meet the control efficiency requirement for any averaging period, as specified in the relevant standard. The owner or operator of the affected source shall maintain records and determine the level of emissions relative to the criterion for permission to use an alternative for relative accuracy testing. If this criterion is exceeded, the owner or operator shall notify the Administrator within 10 days of such occurrence and include a description of the nature and cause of the increased emissions. The Administrator will review the notification and may rescind permission to use an alternative and require the owner or operator to conduct a relative accuracy test of the CEMS as specified in section 7 of Performance Specification 2.

(vii) Reduction of Monitoring Data.

(A) The owner or operator of each CMS shall reduce the monitoring data as specified in this paragraph. In addition, each relevant standard may contain additional requirements for reducing monitoring data. When additional requirements are specified in a relevant standard, the standard will identify any unnecessary or duplicated requirements in this paragraph that the owner or operator need not comply with.

(B) The owner or operator of each COMS shall reduce all data to 6-minute averages calculated from 36 or more data points equally spaced over each 6-minute period. Data from CEMS for measurement other than opacity, unless otherwise

specified in the relevant standard, shall be reduced to 1-hour averages computed from four or more data points equally spaced over each 1-hour period, except during periods when calibration, quality assurance, or maintenance activities pursuant to provisions of this section are being performed. During these periods, a valid hourly average shall consist of at least two data points with each representing a 15-minute period. Alternatively, an arithmetic or integrated 1-hour average of CEMS data may be used. Time periods for averaging are defined in subsection (e).

(C) The data may be recorded in reduced or nonreduced form (e.g., ppm pollutant and percent O₂ or ng/J of pollutant).

(D) All emission data shall be converted into units of the relevant standard for reporting purposes using the conversion procedures specified in that standard. After conversion into units of the relevant standard, the data may be rounded to the same number of significant digits as used in that standard to specify the emission limit (e.g., rounded to the nearest 1 percent opacity).

(E) Monitoring data recorded during periods of unavoidable CMS breakdowns, out-of-control periods, repairs, maintenance periods, calibration checks, and zero (low-level) and high-level adjustments shall not be included in any data average computed under this section.

(k) Notification Requirements.

(i) Applicability and General Information.

(A) The requirements in this subsection apply to owners and operators of affected sources that are subject to the provisions of this section, unless specified otherwise in a relevant standard.

(B) For affected sources that have been granted an extension of compliance under 40 CFR part 63, Subpart D, the requirements of this subsection do not apply to those sources while they are operating under such compliance extensions.

(C) The owner or operator of an affected source, which is subject to the notification requirements shall submit notifications to the Administrator. The owner or operator shall send a copy of each notification submitted to the Administrator to the appropriate regional office of the EPA, to satisfy the requirements of this section for that notification. The regional office may waive this requirement for any notifications at its discretion.

(ii) Initial Notifications.

(A) (I) The requirements of this paragraph apply to the owner or operator of an affected source when such source becomes subject to a relevant standard.

(II) If an area source that otherwise would be subject to an emission standard or other requirement established under this section if it were a major source subsequently increases its emissions of hazardous air pollutants (or its potential to emit hazardous air pollutants) such that the source is a major source that is subject to the emission standard or other requirement, such source shall be subject to the notification requirements of this subsection.

(III) Affected sources that are required under this paragraph to submit an initial notification may use the application for approval of construction or reconstruction under Chapter 6, Section 5(a)(iii), if relevant, to fulfill the initial notification requirements of this paragraph.

(B) The owner or operator of an affected source that has an initial startup before the effective date of a relevant standard under this section shall notify the Administrator in writing that the source is subject to the relevant standard. The notification, which shall be submitted not later than 120 calendar days after the effective date of the relevant standard (or within 120 calendar days after the source becomes subject to the relevant standard), shall provide the following information:

(I) The name and address of the owner or operator;

(II) The address (i.e., physical location) of the affected source;

(III) An identification of the relevant standard, or other requirement, that is the basis of the notification and the source's compliance date;

(IV) A brief description of the nature, size, design, and method of operation of the source, including its operating design capacity and an identification of each point of emission for each hazardous air pollutant, or if a definitive identification is not yet possible, a preliminary identification of each point of emission for each hazardous air pollutant; and

(V) A statement of whether the affected source is a major source or an area source.

(C) The owner or operator of a new or reconstructed affected source, or a source that has been reconstructed such that it is an affected source, that has an initial startup after the effective date of a relevant standard under this section and for which an application for approval of construction or reconstruction is not required under Chapter 6, Section 5(a)(iii), shall notify the Administrator in writing that the source is

subject to the relevant standard no later than 120 after initial startup. The notification shall provide all the information required in paragraphs (ii)(B)(I) through (ii)(B)(V) of this subsection, delivered or postmarked with the notification required in paragraph (ii)(E).

(D) The owner or operator of a new or reconstructed major affected source that has an initial startup after the effective date of a relevant standard under this section and for which an application for approval of construction or reconstruction is required under Chapter 6, Section 5(a)(iii) shall provide the following information in writing to the Administrator:

(I) A notification of intention to construct a new major affected source, reconstruct a major affected source, or reconstruct a major source such that the source becomes a major affected source with the application for approval of construction or reconstruction as specified in Chapter 6, Section 5(a)(iii)(A)(I);

(II) A notification of the date when construction or reconstruction was commenced, submitted simultaneously with the application for approval of construction or reconstruction, if construction or reconstruction was commenced before the effective date of the relevant standard;

(III) A notification of the date when construction or reconstruction was commenced, delivered or postmarked not later than 30 days after such date, if construction or reconstruction was commenced after the effective date of the relevant standard;

(IV) A notification of the anticipated date of startup of the source, delivered or postmarked not more than 60 days nor less than 30 days before such date; and

(V) A notification of the actual date of startup of the source, delivered or postmarked within 15 calendar days after that date.

(E) After the effective date of any relevant standard under this section, an owner or operator who intends to construct a new affected source or reconstruct an affected source subject to such standard, or reconstruct a source such that it becomes an affected source subject to such standard, shall notify the Administrator, in writing, of the intended construction or reconstruction. The notification shall be submitted as soon as practicable before the construction or reconstruction is planned to commence (but no sooner than the effective date of the relevant standard) if the construction or reconstruction commences after the effective date of a relevant standard promulgated in this section. The notification shall be submitted as soon as practicable before startup but no later than 60 days after the effective date of a relevant standard promulgated in this section if the construction or reconstruction had commenced and initial startup had not occurred before the standard's effective date. The notification shall

include all the information required for an application for approval of construction or reconstruction as specified in Chapter 6, Section 5(a)(iii). For major sources, the application for approval of construction or reconstruction may be used to fulfill the requirements of this paragraph.

(iii) Request for Extension of Compliance. If the owner or operator of an affected source cannot comply with a relevant standard by the applicable compliance date for that source, or if the owner or operator has installed BACT or technology to meet LAER consistent with subsection (h)(viii)(E) of this section a request for an extension of compliance may be submitted to the Administrator as specified in subsection (h)(viii)(D) through subsection (h)(viii)(F).

(iv) Notification That Source is Subject to Special Compliance Requirements. An owner or operator of a new source that is subject to special compliance requirements as specified in subsection (h)(ii)(C) and subsection (h)(ii)(D) shall notify the Administrator of the compliance obligations not later than the notification dates established in paragraph (ii) of this subsection for new sources that are not subject to the special provisions.

(v) Notification of Performance Test. The owner or operator of an affected source shall notify the Administrator in writing of the intention to conduct a performance test at least 60 calendar days before the performance test is scheduled to begin to allow the Administrator to review and approve the site-specific test plan required under subsection (i)(iii), if requested by the Administrator, and to have an observer present during the test.

(vi) Notification of Opacity and Visible Emission Observations. The owner or operator of an affected source shall notify the Administrator in writing of the anticipated date for conducting the opacity or visible emission observations specified in subsection (h)(vii)(D), if such observations are required for the source by a relevant standard. The notification shall be submitted with the notification of the performance test date, as specified in paragraph (v) of this subsection, or if no performance test is required or visibility or other conditions prevent the opacity or visible emission observations from being conducted concurrently with the initial performance test required under subsection (i), the owner or operator shall deliver or postmark the notification not less than 30 days before the opacity or visible emission observations are scheduled to take place.

(vii) Additional Notification Requirements for Sources With Continuous Monitoring Systems. The owner or operator of an affected source required to use a CMS by a relevant standard shall furnish the Administrator written notification as follows:

(A) A notification of the date the CMS performance evaluation under subsection (j)(v) is scheduled to begin, submitted simultaneously with the notification of the performance test date required under subsection (i)(ii). If no performance test is required, or if the requirement to conduct a performance test has been

waived for an affected source under subsection (i)(viii), the owner or operator shall notify the Administrator in writing of the date of the performance evaluation at least 60 calendar days before the evaluation is scheduled to begin;

(B) A notification that COMS data results will be used to determine compliance with the applicable opacity emission standard during a performance test required by subsection (i) in lieu of Method 9 or other opacity emissions test method data, as allowed by subsection (h)(vii)(F)(II), if compliance with an opacity emission standard is required for the source by a relevant standard. The notification shall be submitted at least 60 calendar days before the performance test is scheduled to begin; and

(C) A notification that the criterion necessary to continue use of an alternative to relative accuracy testing, as provided by subsection (j)(vi)(F), has been exceeded. The notification shall be delivered or postmarked not later than 10 days after the occurrence of such exceedance, and it shall include a description of the nature and cause of the increased emissions.

(viii) Notification of Compliance Status.

(A) The requirements of paragraphs (viii)(B) through (viii)(C) of this subsection apply when an affected source becomes subject to a relevant standard.

(B) (I) Before an operating permit has been issued to the owner or operator of an affected source, and each time a notification of compliance status is required under this section, the owner or operator of such source shall submit to the Administrator a notification of compliance status, signed by the responsible official who shall certify its accuracy, attesting to whether the source has complied with the relevant standard. The notification shall list:

(1.) The methods that were used to determine compliance;

(2.) The results of any performance tests, opacity or visible emission observations, continuous monitoring system (CMS) performance evaluations, and/or other monitoring procedures or methods that were conducted;

(3.) The methods that will be used for determining continuing compliance, including a description of monitoring and reporting requirements and test methods;

(4.) The type and quantity of hazardous air pollutants emitted by the source (or surrogate pollutants if specified in the relevant standard), reported in units and averaging times and in accordance with the test methods specified in the relevant standard;

(5.) An analysis demonstrating whether the affected source is a major source or an area source (using the emissions data generated for this notification);

(6.) A description of the air pollution control equipment (or method) for each emission point, including each control device (or method) for each hazardous air pollutant and the control efficiency (percent) for each control device (or method); and

(7.) A statement by the owner or operator of the affected existing, new, or reconstructed source as to whether the source has complied with the relevant standard or other requirements.

(II) The notification shall be sent before the close of business on the 60th day following the completion of the relevant compliance demonstration activity specified in the relevant standard (unless a different reporting period is specified in a relevant standard, in which case the letter shall be sent before the close of business on the day the report of the relevant testing or monitoring results is required to be delivered or postmarked). For example, the notification shall be sent before close of business on the 60th (or other required) day following completion of the initial performance test and again before the close of business on the 60th (or other required) day following the completion of any subsequent required performance test. If no performance test is required but opacity or visible emission observations are required to demonstrate compliance with an opacity or visible emission standard under this section, the notification of compliance status shall be sent before close of business on the 30th day following the completion of opacity or visible emission observations.

(C) After an operating permit has been issued to the owner or operator of an affected source, the owner or operator of such source shall comply with all requirements for compliance status reports contained in the source's operating permit, including reports required under this section. After an operating permit has been issued to the owner or operator of an affected source, and each time a notification of compliance status is required under this section, the owner or operator of such source shall submit the notification of compliance status to the Administrator following completion of the relevant compliance demonstration activity specified in the relevant standard.

(D) If an owner or operator of an affected source submits estimates or preliminary information in the application for approval of construction or reconstruction required in Chapter 6, Section 5(a)(iii) in place of the actual emissions data or control efficiencies required in paragraphs (iii)(A)(II)(8.) and (iii)(B) of Chapter 6, Section 5(a), the owner or operator shall submit the actual emissions data and other correct information as soon as available but no later than with the initial notification of compliance status required in this subsection.

(E) Advice on a notification of compliance status may be obtained from the Administrator.

(ix) Adjustment to Time Periods or Postmark Deadlines for Submittal and Review of Required Communications.

(A) (I) Until an adjustment of a time period or postmark deadline has been approved by the Administrator under paragraphs (ix)(B) and (ix)(C) of this subsection, the owner or operator of an affected source remains strictly subject to the requirements of this section.

(II) An owner or operator shall request the adjustment provided for in paragraphs (ix)(B) and (ix)(C) of this subsection each time changes to an applicable time period or postmark deadline specified in this section, are necessary.

(B) Notwithstanding time period or postmark deadlines specified in this section for the submittal of information to the Administrator by an owner or operator, or the review of such information by the Administrator, such time periods or deadlines may be changed by mutual agreement between the owner or operator and the Administrator. An owner or operator who wishes to request a change in a time period or postmark deadline for a particular requirement shall request the adjustment in writing as soon as practicable before the subject activity is required to take place. The owner or operator shall include in the request any information considered useful to convince the Administrator that an adjustment is warranted.

(C) If, in the Administrator's judgment, an owner or operator's request for an adjustment to a particular time period or postmark deadline is warranted, the Administrator will approve the adjustment. The Administrator will notify the owner or operator in writing of approval or disapproval of the request for an adjustment within 15 calendar days of receiving sufficient information to evaluate the request.

(D) If the Administrator is unable to meet a specified deadline, the owner or operator will be notified of any significant delay and inform the owner or operator of the amended schedule.

(x) Change in Information Already Provided. Any change in the information already provided under this subsection shall be provided to the Administrator in writing within 15 calendar days after the change.

(l) Recordkeeping and Reporting Requirements.

(i) Applicability and General Information.

(A) The requirements of this subsection apply to owners or operators of affected sources who are subject to the provisions of this section, unless specified otherwise in a relevant standard.

(B) For affected sources that have been granted an extension of compliance under 40 CFR part 63 Subpart D, the requirements of this subsection do not apply to those sources while they are operating under such compliance extensions.

(C) The owner or operator of an affected source, subject to the recordkeeping and reporting requirements shall submit reports to the Administrator. In addition, the owner or operator shall send a copy of each report submitted to the state to the appropriate regional office of the EPA, to satisfy the requirements of this subsection for that report. The regional office may waive this requirement for any reports at its discretion.

(D) Each owner or operator required to install a continuous monitoring system shall submit a written report of excess emissions (as defined in applicable subparts) to the Administrator for every calendar quarter.

(E) Periodic reports shall be submitted to the Administrator on the following schedules:

(I) All quarterly reports shall be postmarked by the 30th day following the end of each calendar quarter.

(II) All semi-annual reports required in this section and the associated subparts, shall be postmarked by the 30th day following the end of each calendar half.

(F) For each relevant standard established pursuant to section 112 of the Act, the schedule for submitting periodic reports applies beginning 1 year after the affected source's compliance date for that standard. Procedures governing the implementation of this provision are specified in subsection (k)(ix).

(G) If an owner or operator supervises one or more stationary sources affected by more than one standard established pursuant to section 112 of the Act, it may be arranged by mutual agreement between the owner or operator and the Administrator a common schedule on which periodic reports required for each source shall be submitted throughout the year. The allowance in the previous sentence applies beginning 1 year after the latest compliance date for any relevant standard established pursuant to section 112 of the Act for any such affected source(s). Procedures governing the implementation of this provision are specified in subsection (k)(ix).

(H) If an owner or operator supervises one or more stationary sources affected by standards established pursuant to section 112 of the Act (as amended

November 15, 1990) and standards set under 40 CFR part 60, and/or 40 CFR part 61, it may be arranged by mutual agreement between the owner or operator and the Administrator for a common schedule on which periodic reports required by each relevant (i.e., applicable) standard shall be submitted throughout the year. The allowance in the previous sentence applies beginning 1 year after the stationary source is required to be in compliance with the relevant section 112 standard, or 1 year after the stationary source is required to be in compliance with the applicable part 60 or part 61 standard, whichever is latest. Procedures governing the implementation of this provision are specified in subsection (k)(ix).

(ii) General Recordkeeping Requirements.

(A) The owner or operator of an affected source subject to the provisions of this section shall maintain files of all information (including all reports and notifications) required by this section recorded in a form suitable and readily available for expeditious inspection and review. The files shall be retained for at least 5 years following the date of each occurrence, measurement, maintenance, corrective action, report, or record. At a minimum, the most recent 2 years of data shall be retained on site. The remaining 3 years of data may be retained off site. Such files may be maintained on microfilm, on a computer, on computer floppy disks, on magnetic tape disks, or on microfiche.

(B) The owner or operator of an affected source subject to the provisions of this section shall maintain relevant records for such source of:

(I) The occurrence and duration of each startup, shutdown, or malfunction of operation (i.e., process equipment);

(II) The occurrence and duration of each malfunction of the air pollution control equipment;

(III) All maintenance performed on the air pollution control equipment;

(IV) Actions taken during periods of startup, shutdown, and malfunction (including corrective actions to restore malfunctioning process and air pollution control equipment to its normal or usual manner of operation) when such actions are different from the procedures specified in the affected source's startup, shutdown, and malfunction plan [see subsection (h)(iv)(C)];

(V) All information necessary to demonstrate conformance with the affected source's startup, shutdown, and malfunction plan [see subsection (h)(iv)(C)] when all actions taken during period of startup, shutdown, and malfunction (including corrective actions to restore malfunctioning process and air pollution control equipment to its normal or usual manner of operation) are consistent with the procedures

specified in such plan. (The information needed to demonstrate conformance with the startup, shutdown, and malfunction plan may be recorded using a “checklist”, or some other effective form of recordkeeping, in order to minimize the recordkeeping burden for conforming events);

(VI) Each period during which a CMS is malfunctioning or inoperative (including out-of-control periods);

(VII) All required measurements needed to demonstrate compliance with a relevant standard (including, but not limited to, 15-minute averages of CMS data, raw performance testing measurements, and raw performance evaluation measurements, that support data that the source is required to report);

(VIII) All results of performance tests, CMS performance evaluations, and opacity and visible emission observations;

(IX) All measurements as may be necessary to determine the conditions of performance tests and performance evaluations;

(X) All CMS calibration checks;

(XI) All adjustments and maintenance performed on CMS;

(XII) Any information demonstrating whether a source is meeting the requirements for a waiver of recordkeeping or reporting requirements under this section, if the source has been granted a waiver under paragraph (vi) of this subsection;

(XIII) All emission levels relative to the criterion for obtaining permission to use an alternative to the relative accuracy test, if the source has been granted such permission under subsection (j)(vi)(F); and

(XIV) All documentation supporting initial notifications and notifications of compliance status under subsection (k).

(C) Recordkeeping Requirement for Applicability Determinations.

If an owner or operator determines that his or her stationary source that emits (or has the potential to emit, without considering controls) one or more hazardous air pollutants is not subject to a relevant standard or other requirement established under this section, the owner or operator shall keep a record of the applicability determination on site at the source for a period of 5 years after the determination, or until the source changes its operations to become an affected source, whichever comes first. The record of the applicability determination shall include an analysis (or other information) that demonstrates why the owner or operator believes the source is unaffected (e.g., because the source is an area source). The analysis (or other information) shall be sufficiently

detailed to allow the Administrator to make a finding about the source's applicability status with regard to the relevant standard or other requirement. If relevant, the analysis shall be performed in accordance with requirements established in subparts of this section for this purpose for particular categories of stationary sources. If relevant, the analysis should be performed in accordance with EPA guidance materials published to assist sources in making applicability determinations under section 112, if any.

(iii) Additional Recordkeeping Requirements for Sources With Continuous Monitoring Systems. In addition to complying with the requirements specified in paragraphs (ii)(A) and (ii)(B) of this subsection, the owner or operator of an affected source required to install a CMS by a relevant standard shall maintain records for such source of:

(A) All required CMS measurements (including monitoring data recorded during unavoidable CMS breakdowns and out-of-control periods);

(B) The date and time identifying each period during which the CMS was inoperative except for zero (low-level) and high-level checks;

(C) The date and time identifying each period during which the CMS was out of control, as defined in subsection (j)(iii)(G);

(D) The specific identification (i.e., the date and time of commencement and completion) of each period of excess emissions and parameter monitoring exceedances, as defined in the relevant standard(s), that occurs during startups, shutdowns, and malfunctions of the affected source;

(E) The specific identification (i.e., the date and time of commencement and completion) of each time period of excess emissions and parameter monitoring exceedances, as defined in the relevant standard(s), that occurs during periods other than startups, shutdowns, and malfunctions of the affected source;

(F) The nature and cause of any malfunction (if known);

(G) The corrective action taken or preventive measures adopted;

(H) The nature of the repairs or adjustments to the CMS that was inoperative or out of control;

(I) The total process operating time during the reporting period;
and

(J) All procedures that are part of a quality control program developed and implemented for CMS under subsection (j)(iv).

(K) In order to satisfy the requirements of paragraphs (iii)(F) through (iii)(H) of this subsection and to avoid duplicative recordkeeping efforts, the owner or operator may use the affected source's startup, shutdown, and malfunction plan or records kept to satisfy the recordkeeping requirements of the startup, shutdown, and malfunction plan specified in subsection (h)(iv), provided that such plan and records adequately address the requirements of paragraphs (iii)(F) through (iii)(H).

(iv) General Reporting Requirements.

(A) Notwithstanding the requirements in this paragraph or paragraph (v) of this subsection, the owner or operator of an affected source subject to reporting requirements under this section shall submit reports to the Administrator in accordance with the reporting requirements in the relevant standard(s).

(B) Reporting Results of Performance Tests. The results of any performance test performed as required in subsection (i) of Chapter 5, Section 3, or as required in the applicable subparts of 40 CFR part 63 shall be submitted to the Administrator. The owner or operator of an affected source shall report the results of the performance test before the close of business on the 60th day following the completion of the performance test, unless specified otherwise in a relevant standard or as approved otherwise in writing by the Administrator. The results of the performance test shall be submitted as part of the notification of compliance status required under subsection (k)(viii).

(C) Reporting Results of Opacity or Visible Emission Observations. The owner or operator of an affected source required to conduct opacity or visible emission observations by a relevant standard shall report the opacity or visible emission results (produced using Test Method 9 or Test Method 22, or an alternative to these test methods) along with the results of the performance test required under subsection (i). If no performance test is required, or if visibility or other conditions prevent the opacity or visible emission observations from being conducted concurrently with the performance test required under subsection (i), the owner or operator shall report the opacity or visible emission results before the close of business on the 30th day following the completion of the opacity or visible emission observations.

(D) Progress Reports. The owner or operator of an affected source who is required to submit progress reports as a condition of receiving an extension of compliance under subsection (h)(viii) shall submit such reports to the Administrator by the dates specified in the written extension of compliance.

(E) (I) Periodic Startup, Shutdown, and Malfunction Reports. If actions taken by an owner or operator during a startup, shutdown, or malfunction of an affected source (including actions taken to correct a malfunction) are consistent with the procedures specified in the source's startup, shutdown, and malfunction plan [see subsection (h)(iv)(C)], the owner or operator shall state such information in a startup,

shutdown, and malfunction report. Reports shall only be required if a startup, shutdown, or malfunction occurred during the reporting period. The startup, shutdown, and malfunction report shall consist of a letter, containing the name, title, and signature of the owner or operator or other responsible official who is certifying its accuracy, that shall be submitted to the Administrator semiannually (or on a more frequent basis if specified otherwise in a relevant standard or as established otherwise by the Administrator in the source's operating permit). The startup, shutdown, and malfunction report shall be delivered or postmarked by the 30th day following the end of each calendar half (or other calendar reporting period, as appropriate). If the owner or operator is required to submit excess emissions and continuous monitoring system performance (or other periodic) reports under this section, the startup, shutdown, and malfunction reports required under this paragraph may be submitted simultaneously with the excess emissions and continuous monitoring system performance (or other) reports. If startup, shutdown, and malfunction reports are submitted with excess emissions and continuous monitoring system performance (or other periodic) reports, and the owner or operator receives approval to reduce the frequency of reporting for the latter under paragraph (v) of this subsection, the frequency of reporting for the startup, shutdown, and malfunction reports also may be reduced if the Administrator does not object to the intended change. The procedures to implement the allowance in the preceding sentence shall be the same as the procedures specified in paragraph (v)(C) of this subsection.

(II) Immediate Startup, Shutdown, and Malfunction Reports. Notwithstanding the allowance to reduce the frequency of reporting for periodic startup, shutdown, and malfunction reports under paragraph (iv)(E)(I) of this subsection, any time an action taken by an owner or operator during a startup, shutdown, or malfunction (including actions taken to correct a malfunction) is not consistent with the procedures specified in the affected source's startup, shutdown, and malfunction plan, the owner or operator shall report the actions taken for that event within 24 hours of the malfunction followed by a letter within 7 working days after the end of the event. The immediate report required under this paragraph shall consist of a telephone call (or facsimile [FAX] transmission) to the Administrator within 24 hours of the malfunction, and it shall be followed by a letter, delivered or postmarked within 7 working days after the end of the event, that contains the name, title, and signature of the owner or operator or other responsible official who is certifying its accuracy, explaining the circumstances of the event, the reasons for not following the startup, shutdown, and malfunction plan, and whether any excess emissions and/or parameter monitoring exceedances are believed to have occurred. Procedures governing the arrangement of alternative reporting requirements under this paragraph are specified in subsection (k)(ix). Alternative reporting requirements may be established as allowed by the source's operating permit.

(v) Additional Reporting Requirements for Sources With Continuous Monitoring Systems.

(A) General. When more than one CEMS is used to measure the emissions from one affected source (e.g., multiple breechings, multiple outlets), the

owner or operator shall report the results as required for each CEMS.

(B) Reporting Results of Continuous Monitoring System Performance Evaluations.

(I) The owner or operator of an affected source required to install a CMS by a relevant standard shall furnish the Administrator a copy of a written report of the results of the CMS performance evaluation, as required under subsection (j)(v), simultaneously with the results of the performance test required under subsection (i), unless otherwise specified in the relevant standard.

(II) The owner or operator of an affected source using a COMS to determine opacity compliance during any performance test required under subsection (i) and described in subsection (h)(vii)(F) shall furnish the Administrator two or, upon request, three copies of a written report of the results of the COMS performance evaluation conducted under subsection (j)(v). The copies shall be furnished at least 15 calendar days before the performance test required under subsection (i) is conducted.

(C) Excess Emissions and Continuous Monitoring System Performance Report and Summary Report.

(I) Excess emissions and parameter monitoring exceedances are defined in relevant standards. The owner or operator of an affected source required to install a CMS by a relevant standard shall submit an excess emissions and continuous monitoring system performance report and/or a summary report to the Administrator semiannually, except when:

(1.) More frequent reporting is specifically required by a relevant standard;

(2.) The Administrator determines on a case-by-case basis that more frequent reporting is necessary to accurately assess the compliance status of the source; or

(3.) The CMS data are to be used directly for compliance determination and the source experienced excess emissions, in which case quarterly reports shall be submitted. Once a source reports excess emissions, the source shall follow a quarterly reporting format until a request to reduce reporting frequency under paragraph (v)(C)(II) of this subsection is approved.

(II) Request to Reduce Frequency of Excess Emissions and Continuous Monitoring System Performance Reports. Notwithstanding the frequency of reporting requirements specified in paragraph (v)(C)(I) of this subsection, an owner or operator who is required by a relevant standard to submit excess emissions and continuous monitoring system performance (and summary) reports on a quarterly (or

more frequent) basis may reduce the frequency of reporting for that standard to semiannual if the following conditions are met:

(1.) For 1 full year (e.g., 4 quarterly or 12 monthly reporting periods) the affected source's excess emissions and continuous monitoring system performance reports continually demonstrate that the source is in compliance with the relevant standard;

(2.) The owner or operator continues to comply with all recordkeeping and monitoring requirements specified in this section and the relevant standard;

(3.) The Administrator does not object to a reduced frequency of reporting for the affected source, as provided in paragraph (v)(C)(III) of this subsection, and

(4.) The operating permit for the source allows the reduction in frequency of reporting.

(III) The frequency of reporting of excess emissions and continuous monitoring system performance (and summary) reports required to comply with a relevant standard may be reduced only after the owner or operator notifies the Administrator in writing of his or her intention to make such a change and the Administrator does not object to the intended change. In deciding whether to approve a reduced frequency of reporting, the Administrator may review information concerning the source's entire previous performance history during the 5-year recordkeeping period prior to the intended change, including performance test results, monitoring data, and evaluations of an owner or operator's conformance with operation and maintenance requirements. Such information may be used by the Administrator to make a judgment about the source's potential for noncompliance in the future. The Administrator will notify the owner or operator of the approval or disapproval of the request to reduce the frequency of reporting in writing within 45 days after receiving notice of the owner or operator's intention. The notification from the Administrator to the owner or operator will specify the grounds on which a disapproval is based.

(IV) As soon as CMS data indicate that the source is not in compliance with any emission limitation or operating parameter specified in the relevant standard, the frequency of reporting shall revert to the frequency specified in the relevant standard, and the owner or operator shall submit an excess emissions and continuous monitoring system performance (and summary) report for the noncomplying emission points at the next appropriate reporting period following the noncomplying event. After demonstrating ongoing compliance with the relevant standard for another full year, the owner or operator may again request approval from the Administrator to reduce the frequency of reporting for that standard, as provided for in paragraphs (v)(C)(II) and (v)(C)(III) of this subsection.

(V) Content and Submittal Dates for Excess Emissions and Monitoring System Performance Reports. All excess emissions and monitoring system performance reports and all summary reports, if required, shall be delivered or postmarked by the 30th day following the end of each calendar half or quarter, as appropriate. Written reports of excess emissions or exceedances of process or control system parameters shall include all the information required in paragraphs (iii)(B) through (iii)(I) of this subsection, in subsection (j)(iii)(G) and subsection (j)(iii)(H), and in the relevant standard, and they shall contain the name, title, and signature of the responsible official who is certifying the accuracy of the report. When no excess emissions or exceedances of a parameter have occurred, or a CMS has not been inoperative, out of control, repaired, or adjusted, such information shall be stated in the report.

(VI) Summary Report. As required under paragraphs (v)(C)(VII) and (v)(C)(VIII) of this subsection, one summary report shall be submitted for the hazardous air pollutants monitored at each affected source (unless the relevant standard specifies that more than one summary report is required, e.g., one summary report for each hazardous air pollutant monitored). The summary report shall be entitled “Summary Report - Gaseous and Opacity Excess Emission and Continuous Monitoring System Performance” and shall contain the following information:

- (1.) The company name and address of the affected source;
- (2.) An identification of each hazardous air pollutant monitored at the affected source;
- (3.) The beginning and ending dates of the reporting period;
- (4.) A brief description of the process units;
- (5.) The emission and operating parameter limitations specified in the relevant standards(s);
- (6.) The monitoring equipment manufacturer(s) and model number(s);
- (7.) The date of the latest CMS certification or audit;
- (8.) The total operating time of the affected source during the reporting period;

(9.) An emission data summary (or similar summary if the owner or operator monitors control system parameters), including the total duration of excess emissions during the reporting period (recorded in minutes for opacity and hours for gases), the total duration of excess emissions expressed as a percent of the total source operating time during that reporting period, and a breakdown of the total duration of excess emissions during the reporting period into those that are due to startup/shutdown, control equipment problems, process problems, other known causes, and other unknown causes;

(10.) A CMS performance summary (or similar summary if the owner or operator monitors control system parameters), including the total CMS downtime during the reporting period (recorded in minutes for opacity and hours for gases), the total duration of CMS downtime expressed as a percent of the total source operating time during that reporting period, and a breakdown of the total CMS downtime during the reporting period into periods that are due to monitoring equipment malfunctions, nonmonitoring equipment malfunctions, quality assurance/quality control calibrations, other known causes, and other unknown causes;

(11.) A description of any changes in CMS, processes, or controls since the last reporting period;

(12.) The name, title, and signature of the responsible official who is certifying the accuracy of the report; and

(13.) The date of the report.

(VII) If the total duration of excess emissions or process or control system parameter exceedances for the reporting period is less than 1 percent of the total operating time for the reporting period, and CMS downtime for the reporting period is less than 5 percent of the total operating time for the reporting period, only the summary report shall be submitted, and the full excess emissions and continuous monitoring system performance report need not be submitted unless required by the Administrator.

(VIII) If the total duration of excess emissions or process or control system parameter exceedances for the reporting period is 1 percent or greater of the total operating time for the reporting period, or the total CMS downtime for the reporting period is 5 percent or greater of the total operating time for the reporting period, both the summary report and the excess emissions and continuous monitoring system performance report shall be submitted.

(D) Reporting Continuous Opacity Monitoring System Data Produced During a Performance Test. The owner or operator of an affected source required to use a COMS shall record the monitoring data produced during a performance test required under subsection (i) and shall furnish the Administrator a written report of

the monitoring results. The report of COMS data shall be submitted simultaneously with the report of the performance test results required in paragraph (iv)(B) of this subsection.

(vi) Waiver of Recordkeeping or Reporting Requirements.

(A) Until a waiver of a recordkeeping or reporting requirement has been granted by the Administrator under this paragraph, the owner or operator of an affected source remains subject to the requirements of this subsection.

(B) Recordkeeping or reporting requirements may be waived upon written application to the Administrator if, in the Administrator's judgment, the affected source is achieving the relevant standard(s), or the source is operating under an extension of compliance, or the owner or operator has requested an extension of compliance and the Administrator is still considering that request.

(C) If an application for a waiver of recordkeeping or reporting is made, the application shall accompany the request for an extension of compliance under subsection (h)(viii), any required compliance progress report or compliance status report required under this section [such as under subsection (h)(viii) and subsection (k)(viii)] or in the source's operating permit, or an excess emissions and continuous monitoring system performance report required under paragraph (v) of this subsection, whichever is applicable. The application shall include whatever information the owner or operator considers useful to convince the Administrator that a waiver of recordkeeping or reporting is warranted.

(D) The Administrator will approve or deny a request for a waiver of recordkeeping or reporting requirements under this paragraph when the Administrator:

(I) Approves or denies an extension of compliance; or

(II) Makes a determination of compliance following the submission of a required compliance status report or excess emissions and continuous monitoring systems performance report; or

(III) Makes a determination of suitable progress towards compliance following the submission of a compliance progress report, whichever is applicable, and

(IV) It is determined that the Administrator is capable of waiving these requirements under the source's operating permit in accordance with Chapter 6, Section 3.

(E) A waiver of any recordkeeping or reporting requirement granted under this paragraph may be conditioned on other recordkeeping or reporting requirements deemed necessary by the Administrator.

(F) Approval of any waiver granted under this subsection shall not abrogate the Administrator's authority under the Wyoming Environmental Quality Act or in any way prohibit the Administrator from later canceling the waiver. The cancellation will be made only after notice is given to the owner or operator of the affected source.

(m) Control Device Requirements.

(i) Applicability. This subsection contains requirements for control devices used to comply with provisions in relevant standards. These requirements apply only to affected sources covered by relevant standards referring directly or indirectly to this subsection.

(ii) Flares.

(A) Owners or operators using flares to comply with the provisions of this section shall monitor these control devices to assure that they are operated and maintained in conformance with their designs. Applicable subparts will provide provisions stating how owners or operators using flares shall monitor these control devices.

(B) Flares shall be steam-assisted, air-assisted, or non-assisted.

(C) Flares shall be operated at all times when emissions may be vented to them.

(D) Flares shall be designed for and operated with no visible emissions, except for periods not to exceed a total of 5 minutes during any 2 consecutive hours. Test Method 22 in 40 CFR part 60, Appendix A shall be used to determine the compliance of flares with the visible emission provisions of this section. The observation period is 2 hours and shall be used according to Method 22.

(E) Flares shall be operated with a flame present at all times. The presence of a flare pilot flame shall be monitored using a thermocouple or any other equivalent device to detect the presence of a flame.

(F) Flares shall be used only with the net heating value of the gas being combusted at 11.2 MJ/scm (300 Btu/scf) or greater if the flare is steam-assisted or air-assisted; or with the net heating value of the gas being combusted at 7.45 MJ/scm (Btu/scf) or greater if the flare is non-assisted. The net heating value of the gas being combusted in a flare shall be calculated using the following equation:

$$H_T = K \sum_{i=1}^n C_i H_i$$

Where:

H_T = Net heating value of the sample, MJ/scm; where the net enthalpy per mole of offgas is based on combustion at 25°C and 760 mm Hg, but the standard temperature for determining the volume corresponding to one mole is 20°C.

$$K = \text{Constant} = 1.740 \times 10^{-7} \left(\frac{1}{\text{ppmv}} \right) \left(\frac{\text{g-mole}}{\text{scm}} \right) \left(\frac{\text{MJ}}{\text{kcal}} \right)$$

where the standard temperature for (g-mole/scm) is 20°C.

C_i = Concentration of sample component i in ppmv on a wet basis, as measured for organics by Test Method 18 and measured for hydrogen and carbon monoxide by American Society for Testing and Materials (ASTM) D1946-90 (2006) Standard Practice for Analysis of Reformed Gas by Gas Chromatography.

H_i = Net heat of combustion of sample component i , kcal/g-mole at 25°C and 760 mm Hg. The heats of combustion may be determined using ASTM D4809-00 (2005) Standard Test Method for Heat of Combustion of Liquid Hydrocarbon Fuels by Bomb Calorimeter (Precision Method) if published values are not available or cannot be calculated.

n = Number of sample components.

(G) (I) Steam-assisted and nonassisted flares shall be designed for and operated with an exit velocity less than 18.3 m/sec (60 ft/sec), except as provided in paragraphs (ii)(G)(II) and (ii)(G)(III) of this subsection. The actual exit velocity of a flare shall be determined by dividing by the volumetric flow rate of gas being combusted (in units of emission standard temperature and pressure), as determined by Test Methods 2, 2A, 2C, or 2D in 40 CFR part 60, Appendix A, as appropriate, by the unobstructed (free) cross-sectional area of the flare tip.

(II) Steam-assisted and nonassisted flares designed for and operated with an exit velocity, as determined by the method specified in paragraph (ii)(G)(I) of this subsection, equal to or greater than 18.3 m/sec (60 ft/sec) but less than 122 m/sec (400 ft/sec), are allowed if the net heating value of the gas being combusted is greater than 37.3 MJ/scm (1,000 Btu/scf).

(III) Steam-assisted and nonassisted flares designed for and operated with an exit velocity, as determined by the method specified in paragraph (ii)(G)(I) of this subsection, less than the velocity V_{max} , as determined by the method specified in this paragraph, but less than 122 m/sec (400 ft/sec) are allowed. The

maximum permitted velocity, V_{\max} , for flares complying with this paragraph shall be determined by the following equation:

$$\text{Log}_{10}(V_{\max}) = \frac{H_T + 28.80}{31.7}$$

Where:

V_{\max} = Maximum permitted velocity, m/sec.

28.8 = Constant.

31.7 = Constant.

H_T = The net heating value as determined in paragraph (ii)(F) of this subsection.

(H) Air-assisted flares shall be designed and operated with an exit velocity less than the velocity V_{\max} . The maximum permitted velocity, V_{\max} , for air-assisted flares shall be determined by the following equation:

$$V_{\max} = 8.706 + 0.7084(H_T)$$

Where:

V_{\max} = Maximum permitted velocity, m/sec.

8.706 = Constant.

0.7084 = Constant.

H_T = The net heating value as determined in paragraph (ii)(F) of this subsection.

(n) Availability of Information and Confidentiality.

(i) Availability of Information.

(A) With the exception of information protected through sections 35-11-1101(a) and 35-11-205(d) of the Wyoming Environmental Quality Act and subsection (n)(ii), all reports, records, and other information collected by the Administrator under this section, are available to the public. In addition, a copy of each permit application, compliance plan (including the schedule of compliance), notification of compliance status, excess emissions and continuous monitoring systems performance report, and operating permit is available to the public, consistent with protections recognized in section 205(d) of the Wyoming Environmental Quality Act.

(B) The availability to the public of information provided to or otherwise obtained by the Administrator under this section shall be governed by section 35-11-1101 and section 205(d) of the Wyoming Environmental Quality Act.

(ii) Confidentiality.

(A) As provided in sections 35-11-1101(a) and 35-11-205(d) of the Wyoming Environmental Quality Act, upon a satisfactory showing that records,

reports or information or particular parts thereof, other than emission and pollution data, if made public would divulge trade secrets, the records, reports or information or particular portions thereof shall be treated as confidential by the Administrator. The Administrator may also request that the applicant provide this information directly to the EPA.

(I) An applicant who submits information which is desired to be held confidential may do so by stamping the information as “CONFIDENTIAL” and submitting it in a separate envelope marked “CONFIDENTIAL”.

(B) The contents of an operating permit shall not be entitled to protection under this subsection; however, information submitted as part of an application for an operating permit may be entitled to protection from disclosure.

Section 4. **Incorporation by reference.**

(a) Code of Federal Regulations (CFR). All Code of Federal Regulations (CFRs), including their Appendices, cited in this Chapter, revised and published as of July 1, ~~2006~~ 2008, not including any later amendments, are incorporated by reference. Copies of the Code of Federal Regulations are available for public inspection and copies can be obtained at cost from the Department of Environmental Quality, Division of Air Quality, 122 W. 25th Street, Cheyenne, Wyoming 82002. Copies of the CFRs can also be obtained at cost from Government Institutes, 15200 NBN Way, Building B, Blue Ridge Summit, PA 17214.

(b) American Society for Testing and Materials (ASTM). All ASTM standards cited in this Chapter, revised and published as of July 1, ~~2006~~ 2008, not including any later amendments, are incorporated by reference. Copies of the ASTM standards are available for public inspection and copies can be obtained at cost from the Department of Environmental Quality, Division of Air Quality, 122 W. 25th Street, Cheyenne, Wyoming 82002. Copies can also be obtained at cost from the American Society for Testing and Materials, 100 Barr Harbor Drive, Post Office Box C700, West Conshohocken, PA 19428-2959.

**WYOMING DEPARTMENT OF ENVIRONMENTAL QUALITY
AIR QUALITY DIVISION
STANDARDS AND REGULATIONS**

General Emission Standards

CHAPTER 3

Section 1. Introduction to general emission standards.

(a) This Chapter establishes limits on the quantity, rate, or concentration of emissions of air pollutants, including any requirements which limit the level of opacity, prescribe equipment, set fuel specifications, or prescribe operation or maintenance procedures. These general emission standards may be superseded by specific emission standards required in other Chapters of the Wyoming Air Quality Standards and Regulations. Section 9 incorporates by reference all Code of Federal Regulations (CFRs), including their Appendices, cited in this Chapter and all American Society for Testing and Materials (ASTM) standards cited in this Chapter.

Section 2. Emission standards for particulate matter.

(a) Visible emissions of any contaminant discharged into the atmosphere from any single new source of emission whatsoever as determined by a qualified observer shall be limited to 20 percent opacity;

Provided, however, that:

(i) An owner or operator of an affected facility of the type described in Chapter 3, Section 2(h)(i) hereof which has a heat input of not less than 2500×10^6 Btu per hour, may request the Administrator of the Division of Air Quality to determine opacity of emissions from such affected facility during initial performance tests required by Chapter 3, Section 2(i) or during other performance tests thereafter.

(ii) Upon receipt from such owner or operator of the written report of the results of the performance tests required by Chapter 6, Section 2(i) or later performance tests, the Administrator will make a finding concerning compliance with opacity and other applicable standards. If the Administrator finds that such affected facility is in compliance with all applicable standards for which performance tests are conducted but fails to meet any applicable opacity standard, he shall notify the owner or operator and advise him that he may petition the Administrator within 10 days of receipt of notification to make appropriate adjustment to the opacity standard for such affected facility.

(iii) The Administrator will grant such a petition upon a satisfactory demonstration by the owner or operator that such affected facility and associated air pollution control equipment was operated and maintained in a manner to minimize the

opacity of emissions during the performance tests; that the performance tests were performed under the conditions prescribed by the Administrator; and that such affected facility and associated air pollution control equipment were incapable of being adjusted or operated to meet the applicable opacity standard at or near the facility's designed capacity.

(iv) The Administrator will establish an opacity standard for such affected facility meeting the above requirements at a level at which the source will be able, as indicated by the performance and opacity tests, to meet the opacity standard at all times during which the source is meeting the mass or concentration emission standard and during which the facility and air pollution equipment is being operated properly and maintained to minimize the opacity of emissions and mass emission rate.

(b) Visible emissions of any contaminant discharged into the atmosphere from any single existing source of emission whatsoever as determined by a qualified observer shall be limited to 40 percent opacity. This limitation shall not apply to existing incinerators or wood waste burners.

(c) The emissions of visible air pollutants from gasoline engines shall be eliminated except for periods not exceeding five consecutive seconds.

(d) The emissions of visible air pollutants from diesel engines as determined by a qualified observer shall be limited to 30 percent opacity below 7500 feet elevation except for periods not exceeding ten consecutive seconds. This limitation shall not apply during a reasonable period of warm-up following a cold start or where undergoing repairs and adjustment following a malfunction.

(e) Unless restricted by more stringent emission limits established elsewhere in the Wyoming Air Quality Standards and Regulations or permit conditions, any single source may discharge for a period or periods aggregating not more than 6 minutes in any hour contaminants;

(i) Having an equivalent opacity of not more than 40 percent as determined by a qualified observer.

(f) Fugitive Dust. Sources operating within the State of Wyoming are required to control fugitive dust emissions. The following control measures or any equivalent method approved by the Division Administrator shall be considered appropriate for minimizing fugitive dust:

(i) Construction/Demolition Activities.

(A) Any person engaged in clearing or leveling of land, earthmoving, excavation, or movement of trucks or construction equipment over access

haul roads or cleared land shall take steps to minimize fugitive dust from such activities. Such control measures may include frequent watering and/or chemical stabilization.

(B) Any person engaged in demolition activities including razing of homes, buildings, or other structures; or removing paving material from roads and/or parking areas shall take steps to minimize fugitive dust from such activities. Such control measures may include frequent watering and/or chemical stabilization.

(C) Any person who is engaged in construction or demolition activities which tracks earth or other materials onto paved streets shall promptly remove such material by water or other means.

(D) Any person engaged in sandblasting or similar operations shall take steps to minimize fugitive dust from such activities. Such control measures may include the installation and use of hood, fans and fabric filters to enclose and vent the handling of dusty materials.

(ii) Handling and Transporting of Materials.

(A) Any person owning, operating or maintaining a new or existing material storage, handling and/or hauling operation shall minimize fugitive dust from such an operation. Such control measures may include the application of asphalt, oil, water or suitable chemicals on unpaved roads, material stockpiles and other surfaces which can give rise to airborne dusts. Control measures for material handling may also include installation and use of hoods, fans and fabric filters to enclose and vent dusty materials.

(B) When transporting materials likely to give rise to airborne dust, open bodied trucks shall be covered when in motion.

(iii) Agricultural Practices.

(A) Any person engaged in agricultural practices, such as tilling of land and application of fertilizers shall operate in a manner as to minimize fugitive dust emissions.

(g) The emission of particulate matter from any new source shall be limited as indicated in Table I. The emission of particulate matter from any existing source shall be limited as indicated in Table II.

(i) Process weight per hour means the total weight of all materials introduced into any specific process that may cause any emissions of particulate matter, including solid fuels, but excluding liquids or gases and used solely as fuels, and excluding air introduced for purposes of combustion, and excluding the weight of any water, water vapor or steam that may be introduced as part of the total materials.

However, water contained as part of the normal input to a beet pulp dryer process shall be included as part of the process weight per hour. The process weight rate per hour referred to in this section shall be based upon the maximum design production rate of the equipment unless otherwise restricted by enforceable limits on potential to emit.

(ii) For a cyclical or batch operation, the process weight per hour is derived by dividing the total process weight by the number of hours in one complete operation from the beginning of any given process to the completion thereof, excluding any time during which the equipment is idle.

(iii) For a continuous operation, the process weight per hour is derived by dividing the process weight for a typical period of time.

(iv) Emission tests related to this regulation shall be measured in accordance with the requirements of Chapter 3, Section 2(h)(iv).

TABLE I	
PROCESS WEIGHT RATE (lbs/hr)	EMISSION RATE (lbs/hr)
50	0.36
100	0.55
500	1.53
1,000	2.25
5,000	6.34
10,000	9.73
20,000	14.99
60,000	29.60
80,000	31.19
120,000	33.28
160,000	34.85
200,000	36.11
400,000	40.35
1,000,000	46.72

Interpolation of the data in Table I for the process weight rates up to 60,000 lbs/hr shall be accomplished by the use of the equation:

$$E = 3.59 P^{0.62} \quad P \leq 30 \text{ tons/hr}$$

and interpolation and extrapolation of the data for process weight rates in excess of 60,000 lbs/hr shall be accomplished by use of the equation:

$$E = 17.31 P^{0.16} \quad P > 30 \text{ tons/hr}$$

Where: E = Emissions in pounds per hour.
P = Process weight rate in tons per hour.

TABLE II					
PROCESS WEIGHT RATE		RATE OF EMISSION	PROCESS WEIGHT RATE		RATE OF EMISSION
lb/hr	tons/hr	lb/hr	lb/hr	tons/hr	lb/hr
100	0.05	0.551	16,000	8	16.5
200	0.10	0.877	18,000	9	17.9
400	0.20	1.40	20,000	10	19.2
600	0.30	1.83	30,000	15	25.2
800	0.40	2.22	40,000	20	30.5
1,000	0.50	2.58	50,000	25	35.4
1,500	0.75	3.38	60,000	30	40.0
2,000	1.00	4.10	70,000	35	41.3
2,500	1.25	4.76	80,000	40	42.5
3,000	1.50	5.38	90,000	45	43.6
3,500	1.75	5.96	100,000	50	44.6
4,000	2.00	6.52	120,000	60	46.3
5,000	2.50	7.58	140,000	70	47.8
6,000	3.00	8.56	160,000	80	49.0
7,000	3.50	9.49	200,000	100	51.2
8,000	4.00	10.4	1,000,000	500	69.0
9,000	4.50	11.2	2,000,000	1,000	77.6
10,000	5.00	12.0	6,000,000	3,000	92.7
12,000	6.00	13.6			

Interpolation of the data in Table II for process weight rates up to 60,000 lb/hr shall be accomplished by use of the equation $E = 4.10 P^{0.67}$, and interpolation and extrapolation of the data for process weight rates in excess of 60,000 lb/hr shall be accomplished by use of the equation:

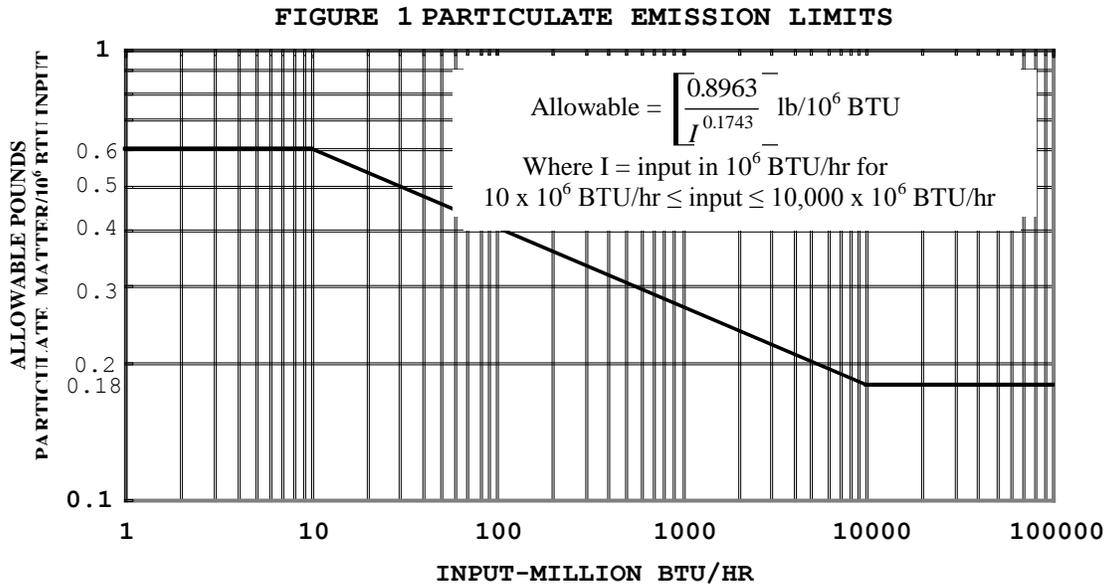

$$E = 55.0 P^{0.11} - 40, \text{ where } E = \text{rate of emission in lb/hr}$$

and P = process weight rate in tons/hr

Notwithstanding any other provision of this Table, any existing air contaminant source utilizing an air pollution control device having a collection efficiency of 99.5 percent or better, shall be deemed to be in compliance with all provisions of this

regulation. Such efficiency shall be determined by a professional engineer licensed to practice in Wyoming and all expenses incurred in such determination shall be defrayed by the person responsible for the emission.

(h) The emissions of particulate matter from existing sources where fuel burning equipment is used for indirect heating shall be limited as shown in Figure 1 and shall be applicable to equipment burning solid fuel.

The emissions of particulate matter from new sources where fuel burning equipment is used for indirect heating shall be limited to 0.10 pound per million Btu input (0.18 grams per million calories) maximum 2-hour average. Except to the extent that an opacity standard has been established for an affected facility pursuant to Chapter 3, Section 2(a)(i) through (iv) hereof, the visible emissions of particulate matter from new sources where fuel burning equipment is used for indirect heating shall be no greater than 20 percent opacity, except that 40 percent opacity shall be permitted for not more than 2 minutes in any hour. This regulation is not applicable to residential or commercial fuel burning equipment with a heat input of less than 10×10^6 Btu/hr and used exclusively to produce building heat.

(i) This regulation applies to installations in which fuel is burned for the primary purpose of producing steam, hot water, or hot air or other indirect heating of liquids, gases, or solids, and, in the course of doing so, the products of combustion do not come into direct contact with process materials. Fuels include those such as coal, coke, lignite, fuel oil, and wood, but do not include refuse. When any products or byproducts of a manufacturing process are burned for the same purpose or in conjunction with any fuel, the same maximum emission limitations shall apply.

(ii) For purposes of this regulation, the heat input shall be the aggregate heat content of all fuels whose products of combustion pass through a stack or stacks, or the heat input value used shall be the equipment manufacturer or designer's guaranteed maximum input, whichever is greater. The total heat input of all fuel burning units at a plant or on a premise shall be used for determining the maximum allowable amount of particulate matter which may be emitted.

(iii) The amount of particulate matter emitted shall be measured by test Methods 1 through 5, Appendix A, 40 CFR part 60. Provided that the Administrator may require that variations to said methods be included or that entirely different methods be utilized if he determines that such variations or different methods are necessary in order for the test data to reflect the actual emission rate of particulate matter.

(i) The emission of particulate matter from any incinerator shall be limited to:

(i) 0.20 pound per 100 pounds (2 grams per kilogram) of refuse charged as determined by a source test method approved by the Division for stationary sources as described in Section 2(h)(ii) of this Chapter;

(ii) A shade or density equal to but not greater than 20 percent opacity as determined by a qualified observer.

Section 3. **Emission standards for nitrogen oxides.**

(a) The emission standards for nitrogen oxides, measured in accordance with Method 7 of 40 CFR part 60, Appendix A or by an equivalent method are:

(i) The emission of nitrogen oxides from new gas fired fuel burning equipment calculated as nitrogen dioxide shall be limited to 0.20 pound per million Btu (0.36 grams per million gram calories) of heat input.

(ii) The emission of nitrogen oxides from existing gas fired fuel burning equipment calculated as nitrogen dioxide shall be limited to 0.23 pound per million Btu (0.41 grams per million gram calories) of heat input.

(iii) The emission of nitrogen oxides from new oil fired fuel burning equipment calculated as nitrogen dioxide shall be limited to 0.30 pounds per million Btu (0.54 grams per million gram calories) of heat input for units having a heat input of 1.0 million Btu per hour (250 million gram calories/hour) or greater and 0.60 pounds per million Btu (1.08 grams per million gram calories) of heat input for units having a heat input less than 1.0 million Btu per hour (250 million gram calories/hour).

(iv) The emission of nitrogen oxides from existing oil fired fuel burning equipment calculated as nitrogen dioxide shall be limited to 0.46 pound per million Btu (0.83 grams per million gram calories) of heat input for units having a heat input of 250

million Btu per hour (62.5 billion gram calories/hour) or greater and 0.60 pound per million Btu (1.08 grams per million gram calories) of heat input for units having a heat input less than 250 million Btu per hour (62.5 billion gram calories/hour).

(v) The emission of nitrogen oxides from new nitric acid manufacturing plants, calculated as nitrogen dioxide shall be limited to 3 pounds per ton (1.5 kilograms per metric ton) of acid produced, maximum 2-hour average.

(vi) The emission of nitrogen oxides from new solid fossil fuel (except lignite) fired fuel burning equipment calculated as nitrogen dioxide shall be limited to 0.70 pounds per million Btu (1.26 grams per million gram calories) heat input.

(vii) The emission of nitrogen oxides from existing solid fossil fuel (except lignite) fired fuel burning equipment calculated as nitrogen dioxide shall be limited to 0.75 pounds per million Btu (1.35 grams per million gram calories) heat input.

(viii) The requirements of Chapter 3, Section 3(a) shall not apply to internal combustion engines having a heat input of less than 200 million Btu per hour.

Section 4. **Emission standards for sulfur oxides.**

(a) Any new facility producing sulfuric acid by the contact process by burning elemental sulfur, alkylation acid, hydrogen sulfide, organic sulfides, mercaptans, or acid sludge shall limit the atmospheric discharge of sulfur dioxide in the effluent to not more than four pounds per ton of acid produced (2 kgm per metric ton)--maximum 2-hour average.

(b) The emission of sulfur dioxide (SO₂) from fuel-burning equipment, the construction of which commences on or after January 1, 1985, shall be limited to the values shown in Table 4a. Compliance with these emission limitations shall be determined on a 30-day rolling average basis and a fixed 3-hour basis, using the emission data obtained from an SO₂ continuous monitoring system installed and operated in accordance with Chapter 5, Section 2(j) of these regulations.

(i) Compliance with the 30-day rolling average shall be determined by calculating the arithmetic average of all hourly SO₂ emission rates for the most recent 30 successive operating days, except for data obtained during operation under Chapter 1, Section 5 of these regulations.

(A) The initial performance test period shall consist of the first 30 days of operation of the fuel burning equipment. Using the most recent 30 days of operation of the fuel burning equipment, a new 30-day average compliance determination for SO₂ is calculated for each successive operating day. These determinations will each constitute a separate performance test.

(B) For the purpose of calculating 30-day average emissions, the minimum amount of emissions data required is 75 percent of the operating hours during each operating day in at least 22 out of 30 successive operating days. A minimum of two data points are required to calculate each one-hour average. If, during any 30-day period, the minimum amount of emission data is not obtained because of continuous monitoring system breakdowns, repairs, calibration checks, or zero and span adjustments, the owner or operator of the continuous monitoring system must notify the Administrator pursuant to Chapter 3, Section 4(b)(iii) of the cause(s) for such loss of data and must immediately initiate corrective action necessary to resume acceptable performance of the continuous monitoring system.

(ii) Compliance with the 3-hour SO₂ emission rate shall be determined for fixed 3-hour periods and shall use all hourly SO₂ emission rates including data obtained during periods of operation under Chapter 3, Section 4(b)(iii) and excluding periods of operation under Chapter 1, Section 5 of these regulations. The maximum 3-hour SO₂ emission rate is not to be exceeded more than once per calendar year.

(iii) The owner or operator shall, within 3 hours of malfunction or failure of the continuous emission monitors to operate, notify the Administrator of such malfunction or failure and shall utilize such alternate monitoring methods as may be required by the Administrator during such period. Emission rate data gathered during such periods pursuant to the alternate methods required by the Administrator shall be used in the determination of compliance with the 30-day rolling average value and the 3-hour value.

TABLE 4a		
TYPE OF FUEL	ALLOWABLE SO₂ EMISSION RATE⁽¹⁾ (lb/10⁶ Btu Heat Input)	
	30-DAY ROLLING AVG.	MAXIMUM 3-HR AVG.
COAL	0.2	0.45
OIL	0.8	0.8

⁽¹⁾ Applicable to individual fuel burning equipment units with a heat input of 250 x 10⁶ Btu/hr or greater.

(c) The emission of sulfur dioxide (SO₂) from fuel-burning equipment, the construction of which commenced after January 1, 1974 and prior to January 1, 1985, shall be limited to the 30-day rolling average values shown in Table 4a, calculated on the basis of a 2-hour average.

Provided, however, that the owner or operator of any facility subject to the compliance provisions of this section may elect by written notice to the Administrator, to be subject to the compliance provisions of Chapter 3, Section 4(b) of these regulations. Thirty days after such notification, the emission limitations and compliance determination

methods and provisions of Chapter 3, Section 4(b), in their entirety, shall become applicable and binding upon such facility.

(d) The emission of sulfur dioxide (SO₂) from fuel burning equipment, the construction of which commenced prior to January 1, 1974, shall be limited to the values shown in Table 4b, calculated on the basis of 2-hour averages or an equivalent method.

For the purpose of this section, operation of a continuous SO₂ emission monitoring system and the calculation of emission rates on the basis of 30-day rolling averages with a maximum 3-hour emission rate shown in Table 4c, when conducted in accordance with Chapter 3, Section 4(b) and Chapter 5, Section 2(j) of these regulations, is an equivalent method for determining compliance with the emission limitations specified in Table 4b. Upon written notice to the Administrator, the owner or operator of any facility that is subject to the compliance provisions of this section may elect the use of continuous emission monitoring systems with a 30-day averaging and maximum 3-hour emission rate as an equivalent method. Thirty days after such notification, the compliance determination method provision of Chapter 3, Section 4(b) shall become applicable and binding upon such facility.

TABLE 4B			
ALLOWABLE SO₂ EMISSION RATE⁽²⁾			
(LB/10⁶ BTU HEAT INPUT)			
FUEL	HEAT INPUT BETWEEN 250x10⁶ BTU/HR & 2500x10⁶ BTU/HR	HEAT INPUT BETWEEN 2500x10⁶ BTU/HR & 5000x10⁶ BTU/HR	HEAT INPUT GREATER THAN 5000x10⁶ BTU/HR
COAL	1.2	0.5	0.3

⁽²⁾ Applicable to individual fuel burning equipment units with the noted heat input values.

TABLE 4C				
ALLOWABLE SO₂ EMISSION RATE⁽³⁾				
(LB/10⁶ BTU HEAT INPUT)				
FUEL	AVERAGING PERIOD	HEAT INPUT BETWEEN 250x10⁶ BTU/HR & 2500x10⁶ BTU/HR	HEAT INPUT BETWEEN 2500x10⁶ BTU/HR & 5000x10⁶ BTU/HR	HEAT INPUT GREATER THAN 5000x10⁶ BTU/HR
COAL	30-DAY ROLLING	1.2	0.5	0.3
COAL	3-HOUR FIXED ⁽⁴⁾	1.2	1.2	0.65

⁽³⁾ Applicable to individual fuel burning equipment units with the noted heat input values.

⁽⁴⁾ Not to be exceeded more than once per year.

(e) For purposes of Chapter 3, Section 4(b), 4(c), and 4(d) of these regulations, the heat input shall be the aggregate heat content of all fuels whose products of combustions pass through a stack or stacks, or the heat input value used shall be the equipment manufacturer's or designer's guaranteed maximum input, whichever is greater.

(f) For the purposes of Chapter 3, Section 4(b), 4(c), and 4(d) of these regulations where a two-hour average, or a 3-hour average will be used, the SO₂ emission rate shall be determined in accordance with Reference Method 6, Appendix A, 40 CFR part 60 or an equivalent method or in accordance with the compliance provisions of Chapter 3, Section 4(b), if the notification provisions of 4(c) and 4(d) are followed.

Section 5. **Emission standards for carbon monoxide.**

(a) The emission of carbon monoxide in stack gases from any stationary source shall be limited as may be necessary to prevent ambient standards described in Chapter 2, Section 5 from being exceeded. Measures considered appropriate for such control are:

(i) Treatment of the waste gas stream by installation and use of a direct flame afterburner or other means which will achieve the required reduction as approved by the Division.

Section 6. **Emission standards for volatile organic compounds.**

(a) The term "**volatile organic compounds**" (**VOCs**) is defined in 40 CFR § ~~51.100(s)(1)~~. 51.100(s), 51.100(s)(1), and 51.100(s)(5), incorporated by reference under Section 9(a) of this chapter.

(b) VOC emissions shall be limited through the application of Best Available Control Technology (BACT) in accordance with Chapter 6, Section 2 of these regulations. Notwithstanding the above, whenever acceptable control of VOC emissions from vapor blowdown, emergency relief systems, or VOC emissions generated from oil and gas production, storage, exploration, development, or processing operations is specified pursuant to these regulations as a flare, the flare shall not exceed a 20 percent opacity emission standard. If acceptable control of VOC emissions is specified as a smokeless flare, the definition given in subsection (i) of this section applies.

(i) For the purposes of this section, "**smokeless flare**" means a flare designed for and operated with no visible emissions except for periods not to exceed a total of 5 minutes during any 2 consecutive hours.

(ii) Each flare subject to Chapter 3, Section 6(b) must be equipped and operated with an automatic igniter or a continuous burning pilot which must be maintained in good working order.

Section 7. **Emission standards for hydrogen sulfide.**

(a) Any exit process gas stream containing hydrogen sulfide which is discharged to the atmosphere from any source shall be vented, incinerated, flared or otherwise disposed of in such a manner that ambient sulfur dioxide and hydrogen sulfide standards described in Chapter 2, Sections 4 and 7 are not exceeded.

Section 8. **Emission standards of asbestos for demolition, renovation, manufacturing, spraying and fabricating.**

(a) Applicability. The provisions of this section are applicable to those sources specified in paragraphs (g) through (n), (q), and (r).

(b) Definitions. All terms that are used in this section and are not defined below are given the same meaning as in Chapter 1, Section 3 of these regulations.

“Active waste disposal site” means any disposal site other than an inactive site.

“Adequately wet” means sufficiently mix or penetrate with liquid to prevent the release of particulates. If visible emissions are observed coming from asbestos-containing material, then that material has not been adequately wetted. However, the absence of visible emissions is not sufficient evidence of being adequately wet.

“Asbestos” means the asbestiform varieties of serpentinite (chrysotile), riebeckite (crocidolite), cummingtonite-grunerite, anthophyllite, and actinolite-tremolite.

“Asbestos-containing waste materials” means mill tailings or any waste that contains commercial asbestos and is generated by a source subject to the provisions of this section. This term includes filters from control devices, friable asbestos waste material, and bags or other similar packaging contaminated with commercial asbestos. As applied to demolition and renovation operations, this term also includes regulated asbestos-containing material waste and materials contaminated with asbestos including disposable equipment and clothing.

“Asbestos tailings” means any solid waste that contains asbestos and is a product of asbestos mining or milling operations.

“Asbestos waste from control devices” means any waste material that contains asbestos and is collected by a pollution control device.

“Category I nonfriable asbestos-containing material (ACM)” means asbestos-containing packings, gaskets, resilient floor covering, and asphalt roofing

products containing more than 1 percent asbestos as determined using the method specified in Appendix J to 29 CFR § 1910.1001, Polarized Light Microscopy of Asbestos.

“Category II nonfriable ACM” means any material, excluding Category I nonfriable ACM, containing more than 1 percent asbestos as determined using the methods specified in Appendix J to 29 CFR § 1910.1001, Polarized Light Microscopy of Asbestos that, when dry, cannot be crumbled, pulverized, or reduced to powder by hand pressure.

“Commercial asbestos” means any material containing asbestos that is extracted from ore and has value because of its asbestos content.

“Cutting” means to penetrate with a sharp-edged instrument and includes sawing, but does not include shearing, slicing, or punching.

“Demolition” means the wrecking or taking out of any load-supporting structural member of a facility together with any related handling operations or the intentional burning of any facility.

“Emergency renovation operation” means a renovation operation that was not planned but results from a sudden, unexpected event that, if not immediately attended to, presents a safety or public health hazard, is necessary to protect equipment from damage, or is necessary to avoid imposing an unreasonable financial burden. This term includes operations necessitated by nonroutine failures of equipment.

“Fabricating” means any processing (e.g., cutting, sawing, drilling) of a manufactured product that contains commercial asbestos, with the exception of processing at temporary sites (field fabricating) for the construction or restoration of facilities. In the case of friction products, fabricating includes bonding, debonding, grinding, sawing, drilling, or other similar operations performed as part of fabricating.

“Facility” means any institutional, commercial, public, industrial, or residential structure, installation, or building (including any structure, installation, or building containing condominiums or individual dwelling units operated as a residential cooperative, but excluding residential buildings having four or fewer dwelling units); any ship; and any active or inactive waste disposal site. For the purposes of this definition, any building, structure, or installation that contains a loft used as a dwelling is not considered a residential structure, installation, or building. Any structure, installation or building that was previously subject to this section is not excluded, regardless of its current use or function.

“Facility component” means any part of a facility including equipment.

“Friable asbestos material” means any material containing more than 1 percent asbestos as determined using the method specified in Appendix J to 29 CFR §

1910.1001, Polarized Light Microscopy of Asbestos, that, when dry, can be crumbled, pulverized, or reduced to powder by hand pressure. If the asbestos content is less than 10 percent as determined by a method other than point counting by polarized light microscopy (PLM), verify the asbestos content by point counting using PLM.

“Fugitive source” means any source of emissions not controlled by an air pollution control device.

“Glove bag” means a sealed compartment with attached inner gloves used for the handling of asbestos-containing materials. Properly installed and used, glove bags provide a small work area enclosure typically used for small-scale asbestos stripping operations. Information on glove-bag installation, equipment and supplies, and work practices is contained in the Occupational Safety and Health Administration’s (OSHA’s) final rule on occupational exposure to asbestos (29 CFR § 1926.1101(g)(5)(ii)).

“Grinding” means to reduce to powder or small fragments and includes mechanical chipping or drilling.

“In poor condition” means the binding of the material is losing its integrity as indicated by peeling, cracking, or crumbling of the material.

“Inactive waste disposal site” means any disposal site or portion of it where additional asbestos-containing waste material has not been deposited within the past year.

“Installation” means any building or structure or any group of buildings or structures at a single demolition or renovation site that are under the control of the same owner or operator (or owner or operator under common control).

“Leak-tight” means that solids or liquids cannot escape or spill out. It also means dust-tight.

“Malfunction” means any sudden and unavoidable failure of air pollution control equipment or process equipment or of a process to operate in a normal or usual manner so that emissions of asbestos are increased. Failures of equipment shall not be considered malfunctions if they are caused in any way by poor maintenance, careless operation, or any other preventable upset conditions, equipment breakdown, or process failure.

“Manufacturing” means the combining of commercial asbestos--or, in the case of woven friction products, the combining of textiles containing commercial asbestos--with any other material(s), including commercial asbestos, and the processing of this combination into a product. Chlorine production is considered a part of manufacturing.

“Natural barrier” means a natural object that effectively precludes or deters access. Natural barriers include physical obstacles such as cliffs, lakes or other large bodies of water, deep and wide ravines, and mountains. Remoteness by itself is not a natural barrier.

“Nonfriable asbestos-containing material” means any material containing more than 1 percent asbestos as determined using the method specified in Appendix J to 29 CFR § 1910.1001, Polarized Light Microscopy of Asbestos, that, when dry, cannot be crumbled, pulverized, or reduced to powder by hand pressure.

“Nonscheduled renovation operation” means a renovation operation necessitated by the routine failure of equipment, which is expected to occur within a given period based on past operating experience, but for which an exact date cannot be predicted.

“Outside air” means the air outside buildings and structures, including, but not limited to, the air under a bridge or in an open air ferry dock.

“Owner or operator of a demolition or renovation activity” means any person who owns, leases, operates, controls, or supervises the facility being demolished or renovated or any person who owns, leases, operates, controls, or supervises the demolition or renovation operation, or both.

“Particulate asbestos material” means finely divided particles of asbestos or material containing asbestos.

“Planned renovation operations” means a renovation operation, or a number of such operations, in which some RACM will be removed or stripped within a given period of time and that can be predicted. Individual nonscheduled operations are included if a number of such operations can be predicted to occur during a given period of time based on operating experience.

“Regulated asbestos-containing material (RACM)” means: (a) Friable asbestos material, (b) Category I nonfriable ACM that has become friable, (c) Category I nonfriable ACM that will be or has been subjected to sanding, grinding, cutting, or abrading, or (d) Category II nonfriable ACM that has a high probability of becoming or has become crumbled, pulverized, or reduced to powder by the forces expected to act on the material in the course of demolition or renovation operations regulated by this subpart.

“Remove” means to take out RACM or facility components that contain or are covered with RACM from any facility.

“Renovation” means altering a facility or one or more facility components in any way, including the stripping or removal of RACM from a facility component.

Operations in which load-supporting structural members are wrecked or taken out are demolitions.

“Resilient floor covering” means asbestos-containing floor tile, including asphalt and vinyl floor tile, and sheet vinyl floor covering containing more than 1 percent asbestos as determined using polarized light microscopy according to the method specified in Appendix J to 29 CFR § 1910.1001, Polarized Light Microscopy of Asbestos.

“Strip” means to take off RACM from any part of a facility or facility components.

“Structural member” means any load supporting member of a facility, such as beams and load supporting walls; or any nonload-supporting member, such as ceilings and nonload-supporting walls.

“Visible emissions” means any emissions, which are visually detectable without the aid of instruments, coming from RACM or asbestos-containing waste material, or from any asbestos milling, manufacturing, or fabricating operation. This does not include condensed, uncombined water vapor.

“Waste generator” means any owner or operator of a source covered by this section whose act or process produces asbestos-containing waste material.

“Waste shipment record” means the shipping document, required to be originated and signed by the waste generator, used to track and substantiate the disposal of asbestos-containing waste material.

“Working day” means Monday through Friday and includes holidays that fall on any of the days Monday through Friday.

(c) Units and Abbreviations: Used in this section are abbreviations and symbols of units of measure. These are defined as follows:

(i) System International (SI) Units of Measure:

g = gram
kg = kilogram
m = meter
m² = square meter
m³ = cubic meter

(ii) Other Units of Measure:

C = Celsius (centigrade)
F = Fahrenheit
ft² = square feet
ft³ = cubic feet

yd² = square yards
min = minute
oz = ounces

(d) Address: All requests, reports, applications, submittals, and other communications to the Administrator pursuant to this section shall be submitted to the following address:

(i) Wyoming Department of Environmental Quality, Air Quality Division, 122 West 25th Street, Cheyenne, Wyoming 82002.

(e) [Reserved]

(f) Circumvention: No owner or operator shall build, erect, install, or use any article, machine, equipment, process, or method, the use of which conceals an emission which would otherwise constitute a violation of an applicable standard. Such concealment includes, but is not limited to, the use of gaseous dilutants to achieve compliance with a visible emissions standard, and the piecemeal carrying out of an operation to avoid coverage by a standard that applies only to operations larger than a specified size.

(g) Standard for Waste Disposal for Non-Facility Owners and Operators.

(i) All owners and operators conducting an asbestos abatement project, including an abatement project on a residential building, shall be responsible for complying with Federal requirements and State standards for packaging, transportation, and delivery to an approved waste disposal facility as provided in paragraph (m) of this section. A non-facility is any other facility not defined under the definition of "facility" including residential buildings having four or fewer dwelling units.

(h) Standard for Manufacturing.

(i) Applicability. This paragraph applies to the following manufacturing operations using commercial asbestos.

(A) The manufacture of cloth, cord, wicks, tubing, tape, twine, rope, thread, yarn, roving, lap, or other textile materials.

(B) The manufacture of cement products.

(C) The manufacture of fireproofing and insulating materials.

(D) The manufacture of friction products.

(E) The manufacture of paper, millboard, and felt.

- (F) The manufacture of floor tile.
- (G) The manufacture of paints, coatings, caulks, adhesives, and sealants.
- (H) The manufacture of plastics and rubber materials.
- (I) The manufacture of chlorine utilizing asbestos diaphragm technology.
- (J) The manufacture of shotgun shell wads.
- (K) The manufacture of asphalt concrete.

(ii) Standard. Each owner or operator of any of the manufacturing operations to which this paragraph applies shall either:

(A) Discharge no visible emissions to the outside air from these operations or from any building or structure in which they are conducted or from any fugitive sources; or

(B) Use the methods specified by paragraph (o) of this section to clean emissions containing asbestos material from these operations before they escape to, or are vented to, the outside air.

(C) Monitor each potential source of asbestos emissions from any part of the manufacturing facility, including air cleaning devices, process equipment, and buildings housing material processing and handling equipment, at least once each day during daylight hours for visible emissions to the outside air during periods of operation. The monitoring shall be by the visual observation of at least 15 seconds duration per source of emissions.

(D) Inspect each air cleaning device at least once each week for proper operation and for changes that signal potential for malfunctions, including, to the maximum extent possible without dismantling other than opening the device, the presence of tears, holes, and abrasions in filter bags and for dust deposits on the clean side of bags. For air cleaning devices that cannot be inspected on a weekly basis according to this paragraph, submit to the Administrator, and revise as necessary, a written maintenance plan to include, at a minimum, the following:

- (I) Maintenance schedule.
- (II) Recordkeeping plan.

(E) Maintain records of the results of visible emission monitoring and air cleaning device inspections using a format similar to that shown in Figures 1 and 2 and include the following:

(I) Date and time of each inspection.

(II) Presence or absence of visible emissions.

(III) Condition of fabric filters, including presence of any tears, holes and abrasions.

Figure 1. Record of Visible Emission Monitoring

_____	_____	_____	_____	

(IV) Presence of dust deposits on clean side of fabric filters.

(V) Brief description of corrective actions taken, including date and time.

(VI) Daily hours of operation for each air cleaning device.

(F) Furnish upon request, and make available at the affected facility during normal business hours for inspection by the Administrator, all records required under this paragraph.

(G) Retain a copy of all monitoring and inspection records for at least 2 years.

(H) Submit quarterly a copy of the visible emission monitoring records to the Administrator if visible emissions occurred during the report period. Quarterly reports shall be postmarked by the 30th day following the end of the calendar quarter.

(i) Standard for Demolition and Renovation.

(i) Applicability. To determine which requirements of paragraphs (i)(i), (i)(ii), and (i)(iii) apply to the owner or operator of a demolition or renovation activity and prior to the commencement of the demolition or renovation, thoroughly inspect the affected facility or part of the facility where the demolition or renovation operation will occur for the presence of asbestos, including Category I and Category II nonfriable ACM. The requirements of paragraphs (i)(ii) and (i)(iii) apply to each owner or operator of a demolition or renovation activity, including the removal of RACM as follows:

(A) In a facility being demolished, all the requirements of paragraphs (i)(ii) and (i)(iii) apply, except as provided in paragraph (i)(i)(C), if the combined amount of RACM is:

(I) At least 80 linear meters (260 linear feet) on pipes or at least 15 square meters (160 square feet) on other facility components, or

(II) At least 1 cubic meter (35 cubic feet) off facility components where the length or area could not be measured previously.

(B) In a facility being demolished, only the notification requirements of paragraphs (i)(ii)(A), (B), (C)(I) and (IV), and (D)(I) through (D)(IX) and (XVI) apply, if the combined amount of RACM is:

(I) Less than 80 linear meters (260 linear feet) on pipes and less than 15 square meters (160 square feet) on other facility components, and

(II) Less than one cubic meter (35 cubic feet) off facility components where the length or area could not be measured previously or there is no asbestos.

(C) If the facility is being demolished under an order of a State or local government agency, issued because the facility is structurally unsound and in danger of imminent collapse, only the requirements of paragraphs (i)(ii)(A), (i)(ii)(B), (i)(ii)(C)(III), (i)(ii)(D) (except (i)(ii)(D)(VIII)), (i)(ii)(E), and (i)(iii)(D) through (i)(iii)(I) apply.

(D) In a facility being renovated, including any individual nonscheduled renovation operation, all the requirements of paragraphs (i)(ii) and (i)(iii) apply if the combined amount of RACM to be stripped, removed, dislodged, cut, drilled, or similarly disturbed is:

(I) At least 80 linear meters (260 linear feet) on pipe or at least 15 square meters (160 square feet) on other facility components, or

(II) At least 1 cubic meter (35 cubic feet) off facility components where the length or area could not be measured previously.

(III) To determine whether paragraph (i)(i)(D) applies to planned renovation operations involving individual nonscheduled operations, predict the combined additive amount of RACM to be removed or stripped during a calendar year or January 1 through December 31.

(IV) To determine whether paragraph (i)(i)(D) applies to emergency renovation operations, estimate the combined amount of RACM to be removed or stripped as a result of the sudden, unexpected event that necessitated the renovation.

(E) In a facility being renovated, only the notification requirements of paragraphs (i)(ii)(A), (B), (C)(I) and (IV), and (D)(I) through (IX) and (XVI) apply, if the combined amount of RACM is:

(I) Less than 80 linear meters (260 linear feet) on pipes or less than 15 square meters (160 square feet) on other facility components, and

(II) Less than 1 cubic meter (35 cubic feet) off facility components where the length or area could not be measured previously or there is no asbestos.

(ii) Notification Requirements. Each owner or operator of a demolition or renovation activity to which this section applies shall:

(A) Provide the Administrator with written notice of intention to demolish or renovate. Delivery of the notice by U.S. Postal Service, commercial delivery service, or hand delivery is acceptable.

(B) Update notice, as necessary, including when the amount of asbestos affected changes by at least 20 percent.

(C) Postmark or deliver the notice as follows:

(I) At least 10 working days before asbestos stripping or removal work or any other activity begins (such as site preparation that would break up, dislodge or similarly disturb asbestos material), if the operation is described in paragraphs (i)(i)(A) and (D) (except (i)(i)(D)(III) and (i)(i)(D)(IV)). If the operation is as described in paragraph (i)(i)(B), notification is required 10 working days before demolition begins.

(II) At least 10 working days before the end of the calendar year preceding the year for which notice is being given for renovations described in paragraph (i)(i)(D)(III).

(III) As early as possible before, but not later than, the following working day if the operation is a demolition ordered according to paragraph (i)(i)(C) or, if the operation is a renovation described in paragraph (i)(i)(D)(IV).

(IV) For asbestos stripping or removal work in a demolition or renovation operation, described in paragraphs (i)(i)(A) and (D) (except (i)(i)(D)(III) and (i)(i)(D)(IV)), and for a demolition described in paragraph (i)(i)(B), that will begin on a date other than the one contained in the original notice, notice of the new start date must be provided to the Administrator as follows:

(1.) When the asbestos stripping or removal operation or demolition operation covered by this paragraph will begin after the date contained in the notice,

a. Notify the Administrator of the new start date by telephone as soon as possible before the original start date, and

b. Provide the Administrator with a written notice of the new start date as soon as possible before, and no later than, the original start date. Delivery of the updated notice by the U.S. Postal Service, commercial delivery service, or hand delivery is acceptable.

(2.) When the asbestos stripping or removal operation or demolition operation covered by this paragraph will begin on a date earlier than the original start date,

a. Provide the Administrator with a written notice of the new start date at least 10 working days before asbestos stripping or removal work begins.

b. For demolitions covered by paragraph (i)(i)(B), provide the Administrator written notice of a new start date at least 10 working days before commencement of demolition. Delivery of updated notice by U.S. Postal Service, commercial delivery service, or hand delivery is acceptable.

(3.) In no event shall an operation covered by this paragraph begin on a date other than the date contained in the written notice of the new start date.

(D) Include the following in the notice:

(I) An indication of whether the notice is the original or a revised notification.

(II) Name, address, and telephone number of both the facility owner and operator and the asbestos removal contractor owner or operator.

(III) Type of operation: demolition or renovation.

(IV) Description of the facility or affected part of the facility including the size (square meters [square feet] and number of floors), age, and present and prior use of the facility.

(V) Procedure, including analytical methods, employed to detect the presence of RACM and Category I and Category II nonfriable ACM.

(VI) Estimate of the approximate amount of RACM to be removed from the facility in terms of length of pipe in linear meters (linear feet), surface area in square meters (square feet) on other facility components, or volume in cubic meters (cubic feet) if off the facility components. Also estimate the approximate amount of Category I and Category II nonfriable ACM in the affected part of the facility that will not be removed before demolition.

(VII) Location and street address (including building number or name and floor or room number, if appropriate), city, county, and state, or the facility being demolished or renovated.

(VIII) Scheduled starting and completion dates of asbestos removal work (or any other activity, such as site preparation that would break up, dislodge, or similarly disturb asbestos material) in a demolition or renovation; planned renovation operations involving individual nonscheduled operations shall only include the beginning and ending dates of the report period as described in paragraph (i)(i)(D)(III).

(IX) Scheduled starting and completion dates of demolition or renovation.

(X) Description of planned demolition or renovation work to be performed and method(s) to be employed, including demolition or renovation techniques to be used and description of affected facility components.

(XI) Description of work practices and engineering controls to be used to comply with the requirements of this section, including asbestos removal and waste-handling emission control procedures.

(XII) Name and location of the waste disposal site where the asbestos-containing waste material will be deposited.

(XIII) A certification that the individuals supervising and performing the stripping and removal described by this notification have received the training required by paragraph (i)(iii)(H).

(XIV) For facilities described in paragraph (i)(i)(C), the name, title, and authority of the State or local government representative who has ordered the demolition, the date that the order was issued, and the date on which the demolition was ordered to begin. A copy of the order shall be attached to the notification.

(XV) For emergency renovations described in paragraph (b)(xii) of this section, the date and hour that the emergency occurred, a description of the sudden, unexpected event, and an explanation of how the event caused an unsafe condition, or would cause equipment damage or an unreasonable financial burden.

(XVI) Description of procedures to be followed in the event that unexpected RACM is found or Category II nonfriable ACM becomes crumbled, pulverized, or reduced to powder.

(XVII) Name, address, and telephone number of the waste transporter.

(E) The information required in paragraph (i)(ii)(D) must be reported using a form similar to that shown in Figure 3.

(iii) Procedures for Asbestos Emission Control. Each owner or operator of a demolition or renovation activity to whom this paragraph applies, according to paragraph (i)(i), shall comply with the following procedures:

(A) Remove all RACM from a facility being demolished or renovated before any activity begins that would break up, dislodge, or similarly disturb the material or preclude access to the material for subsequent removal. RACM need not be removed before demolition if:

(I) It is Category I nonfriable ACM that is not in poor condition and is not friable.

(II) It is on a facility component that is encased in concrete or other similarly hard material and is adequately wet whenever exposed during demolition; or

(III) It was not accessible for testing and was, therefore, not discovered until after demolition began and, as a result of the demolition, the material cannot be safely removed. If not removed for safety reasons, the exposed RACM and any asbestos-contaminated debris must be treated as asbestos-containing waste material and adequately wet at all times until disposed of.

(IV) They are Category II nonfriable ACM and the probability is low that the materials will become crumbled, pulverized, or reduced to powder during demolition.

(B) When a facility component that contains, is covered with, or is coated with RACM is being taken out of the facility as a unit or in sections:

(I) Adequately wet all RACM exposed during cutting or disjoining operations; and

(II) Carefully lower each unit or section to the floor and to ground level, not dropping, throwing, sliding, or otherwise damaging or disturbing the RACM.

(C) When RACM is stripped from a facility component while it remains in place in the facility, adequately wet the RACM during the stripping operation.

(I) In renovation operations, wetting is not required if:

(1.) The owner or operator has obtained prior written approval from the Administrator based on a written application that wetting to comply with this paragraph would unavoidably damage equipment or present a safety hazard; and

(2.) The owner or operator uses one of the following emission control methods:

a. A local exhaust ventilation and collection system designed and operated to capture the particulate asbestos material produced by the stripping and removal of the asbestos materials. The system must exhibit no visible emissions to the outside air or be designed and operated in accordance with the requirements in paragraph (o).

b. A glove-bag system designed and operated to contain the particulate asbestos material produced by the stripping of the asbestos materials.

c. Leak-tight wrapping to contain all RACM prior to dismantlement.

(II) In renovation operations where wetting would result in equipment damage or a safety hazard, and the methods allowed in paragraph (i)(iii)(C)(I) cannot be used, another method may be used after obtaining written approval from the Administrator based upon a determination that it is equivalent to wetting in controlling emissions or to the methods allowed in paragraph (i)(iii)(C)(I).

(III) A copy of the Administrator's written approval shall be kept at the worksite and made available for inspection.

(D) After a facility component covered with, coated with, or containing RACM has been taken out of the facility as a unit or in sections pursuant to paragraph (i)(iii)(B), it shall be stripped or contained in leak-tight wrapping, except as described in paragraph (i)(iii)(E). If stripped, either:

(I) Adequately wet the RACM during stripping; or

(II) Use a local exhaust ventilation and collection system designed and operated to capture the particulate asbestos material produced by the stripping. The system must exhibit no visible emissions to the outside air or be designed and operated in accordance with the requirements in paragraph (o).

(E) For large facility components such as reactor vessels, large tanks, and steam generators, but not beams (which must be handled in accordance with paragraphs (i)(iii)(B), (C), and (D)), the RACM is not required to be stripped if the following requirements are met:

(I) The component is removed, transported, stored, disposed of, or reused without disturbing or damaging the RACM.

(II) The component is encased in a leak-tight wrapping.

(III) The leak-tight wrapping is labeled according to paragraphs (m)(iv) during all loading and unloading operations and during storage.

(F) For all RACM, including material that has been removed or stripped:

(I) Adequately wet the material and ensure that it remains wet until collected and contained or treated in preparation for disposal in accordance with paragraph (m).

(II) Carefully lower the material to the ground and floor, not dropping, throwing, sliding, or otherwise damaging or disturbing the material.

(III) Transport the material to the ground via leak-tight chutes or containers if it has been removed or stripped more than 50 feet above ground level and was not removed as units or in sections.

(IV) RACM contained in leak-tight wrapping that has been removed in accordance with paragraphs (i)(iii)(D) and (i)(iii)(C)(I)(2).c. need not be wetted.

(G) When the temperature at the point of wetting is below 0°C (32°F):

(I) The owner or operator need not comply with paragraph (i)(iii)(B)(I) and the wetting provisions of paragraph (i)(iii)(C).

(II) The owner or operator shall remove facility components containing, coated with, or covered with RACM as units or in sections to the maximum extent possible.

(III) During periods when wetting operations are suspended due to freezing temperatures, the owner or operator must record the temperature in the area containing the facility components at the beginning, middle, and end of each workday and keep daily temperature records available for inspection by the Administrator during normal business hours at the demolition or renovation site. The owner or operator shall retain the temperature records for at least 2 years.

(H) No RACM shall be stripped, removed, or otherwise handled or disturbed at a facility regulated by this section unless the individuals supervising and performing the operation have been trained in the provisions of this regulation and the means of complying with them. Asbestos School Hazard Abatement Reauthorization Act (ASHARA) training will be acceptable to meet this requirement. Every year, the

individuals supervising and performing asbestos operations shall receive refresher training in the provisions of this regulation. The required training shall include as a minimum: applicability; notifications; material identification; control procedures for removals including, at least, wetting, local exhaust ventilation, negative pressure enclosures, glove-bag procedures, and High Efficiency Particulate Air (HEPA) filters; waste disposal work practices; reporting and recordkeeping; and asbestos hazards and worker protection. Evidence that the required training has been completed shall be posted and made available for inspection by the Administrator at the demolition or renovation site.

(I) For facilities described in paragraph (i)(i)(C), adequately wet the portion of the facility that contains RACM during the wrecking operation.

(J) If a facility is demolished by intentional burning, all RACM including Category I and Category II nonfriable ACM must be removed in accordance with the NESHAP before burning.

(j) Standard for Spraying.

The owner or operator of an operation in which asbestos-containing materials are spray applied shall comply with the following requirements:

(i) For spray-on application on buildings, structures, pipes, and conduits do not use material containing more than 1 percent asbestos as determined using the method specified in Appendix J to 29 CFR § 1910.1001, Polarized Light Microscopy of Asbestos, except as provided in paragraph (j)(iii).

(ii) For spray-on application of materials that contain more than 1 percent asbestos as determined using the method specified in Appendix J to 29 CFR § 1910.1001, Polarized Light Microscopy of Asbestos, on equipment and machinery, except as provided in paragraph (j)(iii):

(A) Notify the Administrator at least 20 days before beginning the spraying operation. Include the following information in the notice:

(I) Name and address of owner or operator.

(II) Location of spraying operation.

(III) Procedures to be followed to meet the requirements of paragraph (j).

(B) Discharge no visible emissions to the outside air from spray-on application of the asbestos-containing material or use the methods specified by

paragraph (o) to clean emissions containing particulate asbestos material before they escape to, or are vented to, the outside air.

(iii) The requirements of paragraphs (j)(i) and (j)(ii) do not apply to the spray-on application of materials where the asbestos fibers in the materials are encapsulated with a bituminous or resinous binder during spraying and the materials are not friable after drying.

(k) Standard for Fabricating.

(i) Applicability. This section applies to the following fabrication operations using commercial asbestos:

(A) The fabrication of cement building products.

(B) The fabrication of friction products, except those operations that primarily install asbestos friction materials on motor vehicles.

(C) The fabrication of cement on silicate board for ventilation hoods; ovens; electrical panels; laboratory furniture, bulkheads, partitions, and ceilings for marine construction; and flow control devices for the molten metal industry.

(ii) Standard. Each owner or operator of any of the fabricating operations to which this section applies shall either:

(A) Discharge no visible emissions to the outside air from any of the operations or from any building or structure in which they are conducted or from any other fugitive sources; or

(B) Use the methods specified by paragraph (o) to clean emissions containing particulate asbestos material before they escape to, or are vented to, the outside air.

(C) Monitor each potential source of asbestos emissions from any part of the fabricating facility, including air cleaning devices, process equipment, and buildings that house equipment for material processing and handling, at least once a day, during daylight hours, for visible emissions to the outside air during periods of operation. The monitoring shall be by visual observation of at least 15 seconds duration per source of emission.

(D) Inspect each air cleaning device at least once each week for proper operation and for changes that signal the potential for malfunctions, including, to the maximum extent possible without dismantling other than opening the device, the presence of tears, holes, and abrasions in the filter bags and for dust deposits on the clean side of bags. For air cleaning devices that cannot be inspected on a weekly basis

according to this paragraph, submit to the Administrator, and revise as necessary, a written maintenance plan to include, at a minimum, the following:

(I) Maintenance schedule.

(II) Recordkeeping plan.

(E) Maintain records of the results of visible emission monitoring and air cleaning device inspections using a format similar to that shown in Figures 1 and 2 and include the following:

(I) Date and time of each inspection.

(II) Presence or absence of visible emissions.

(III) Condition of fabric filters, including presence of any tears, holes, and abrasions.

(IV) Presence of dust deposits on clean side of fabric filters.

(V) Brief description of corrective actions taken, including date and time.

(VI) Daily hours of operation for each air cleaning device.

(F) Furnish upon request and make available at the affected facility during normal business hours for inspection by the Administrator, all records required under this paragraph.

(G) Retain a copy of all monitoring and inspection records for at least 2 years.

(H) Submit quarterly a copy of the visible emission monitoring records to the Administrator if visible emissions occurred during the report period. Quarterly reports shall be postmarked by the 30th day following the end of the calendar quarter.

(I) Standard for Insulating Materials. No owner or operator of a facility may install or reinstall on a facility component any insulating materials that contain commercial asbestos if the materials are either molded and friable or wet-applied and friable after drying. The provisions of this paragraph do not apply to spray-applied insulating materials regulated under paragraph (j).

(m) Standard for Waste Disposal for Non-facilities, Manufacturing, Demolition, Renovation, Spraying, and Fabricating. Each owner or operator of any source covered under the provisions of paragraphs (g), (h), (i), (j), or (k) shall meet the requirements of the Solid Waste Division of the Wyoming Department of Environmental Quality or, at a minimum, the requirements of the following:

(i) Discharge no visible emissions to the outside air during the collection, processing (including incineration), packaging, or transporting of any asbestos-containing waste material generated by the source, or use one of the emission control and waste treatment methods specified in paragraphs (m)(i)(A) through (D).

(A) Adequately wet asbestos-containing waste material as follows:

(I) Mix control device asbestos waste to form a slurry; adequately wet other asbestos-containing waste material; and

(II) Discharge no visible emissions to the outside air from collection, mixing, wetting, and handling operations, or use the methods specified by paragraph (o) to clean emissions containing particulate asbestos material before they escape to, or are vented to, the outside air; and

(III) After wetting, seal all asbestos-containing waste material in leak-tight containers while wet; or, for materials that will not fit into containers without additional breaking, put materials into leak-tight wrapping; and

(IV) Label the containers or wrapped materials specified in paragraph (m)(i)(A)(III) using warning labels specified by Occupational Safety and Health Standards of the Department of Labor, Occupational Safety and Health Administration (OSHA) under 29 CFR § 1910.1001(j)(4) or § 1926.1101(k)(8). The labels shall be printed in letters of sufficient size and contrast so as to be readily visible and legible.

(V) For asbestos-containing waste material to be transported off the facility site, label containers or wrapped materials with the name of the waste generator and the location at which the waste was generated.

(B) Process asbestos-containing waste material into nonfriable forms as follows:

(I) Form all asbestos-containing waste material into nonfriable pellets or other shapes;

(II) Discharge no visible emissions to the outside air from collection and processing operations, including incineration, or use the method specified

by paragraph (o) to clean emissions containing particulate asbestos materials before they escape to, or are vented to, the outside air.

(C) For facilities demolished where the RACM is not removed prior to demolition, adequately wet asbestos-containing waste material at all times after demolition and keep wet during handling and loading for transport to a disposal site. Asbestos-containing waste materials covered by this paragraph do not have to be sealed in leak-tight containers or wrapping but may be transported and disposed of in bulk.

(D) Use an alternative emission control and waste treatment method that has received prior written approval by the EPA Administrator.

(E) As applied to demolition and renovation, the requirements of paragraph (m)(i) do not apply to Category I and Category II nonfriable ACM waste that did not become crumbled, pulverized, or reduced to powder.

(ii) All asbestos-containing waste material shall be deposited as soon as is practical by the waste generator at:

(A) A waste disposal site operated in accordance with the provisions of paragraph (q), or

(B) An EPA-approved site that converts RACM and asbestos-containing waste material into nonasbestos (asbestos-free) material according to the provisions of paragraph (r).

(C) The requirements of paragraph (m)(ii) do not apply to Category I nonfriable ACM that is not RACM.

(iii) Mark vehicles used to transport asbestos-containing waste material during the loading and unloading of waste so that the signs are visible. The markings must:

(A) Be displayed in such a manner and location that a person can easily read the legend.

(B) Conform to the requirements for 51 cm X 36 cm (20 in X 14 in) upright format signs specified in 29 CFR § 1910.145(d)(2) and this paragraph; and

(C) Display the following legend in the lower panel with letter sizes and styles of a visibility at least equal to those specified below.

Legend
DANGER
ASBESTOS DUST HAZARD
CANCER AND LUNG DISEASE HAZARD
Authorized Personnel Only

Notation
2.5 cm (1 inch) Sans Serif, Gothic or Block
2.5 cm (1 inch) Sans Serif, Gothic or Block
1.9 cm (3/4 inch) Sans Serif, Gothic or Block
14 Point Gothic

Spacing between any two lines must be at least equal to the height of the upper of the two lines.

(iv) For All Asbestos-Containing Waste Material Transported Off the Facility Site:

(A) Maintain waste shipment records, using a form similar to that shown in Figure 4, and include the following information:

(I) The name and telephone number of the disposal site operator.

(II) The name and physical site location of the disposal site.

(III) The date transported.

(IV) The name, address, and telephone number of the transporter(s).

GENERATOR		
1. Work site name and mailing address	Owner's name	Owner's telephone no.
2. Operator's name and address		Operator's telephone no.
3. Waste disposal site (WDS) name, mailing address, and physical site location		WDS telephone no.
4. Name and address of responsible agency		
5. Description of materials	6. Containers No. Type	7. Total quantity m ³ (yd ³)
8. Special handling instructions and additional information		
9. OPERATOR'S CERTIFICATION: I hereby declare that the contents of this consignment are fully and accurately described above by proper shipping name and are classified, packed, marked, and labeled, and are in all respects in proper condition for transport by highway according to applicable international and government regulations.		
Printed/typed name & title	Signature	Month Day Year

11. Transporter 2 (Acknowledgment of receipt of materials)		
Printed/typed name & title Address and telephone no.	Signature	Month Day Year
Disposal Site		
12. Discrepancy indication space		
13. Waste disposal site owner or operator: Certification of receipt of asbestos materials covered by this manifest except as noted in item 12.		
Printed/typed name & title	Signature	Month Day Year

Figure 4. Waste Shipment Record

(V) A certification that the contents of this consignment are fully and accurately described by proper shipping name and are classified, packed, marked, and labeled, and are in all respects in proper condition for transport by highway according to applicable international and governmental regulations.

(B) Provide a copy of the waste shipment record, described in paragraph (m)(iv)(A), to the disposal site owners or operators at the same time as the asbestos-containing waste material is delivered to the disposal site.

(C) For waste shipments where a copy of the waste shipment record, signed by the owner or operator of the designated disposal site, is not received by the waste generator within 35 days of the date the waste was accepted by the initial transporter, contact the transporter and/or the owner or operator of the designated disposal site to determine the status of the waste shipment.

(D) Report in writing to the Wyoming Department of Environmental Quality, Air Quality Division, if a copy of the waste shipment record, signed by the owner or operator of the designated waste disposal site, is not received by the waste generator within 45 days of the date the waste was accepted by the initial transporter. Include in the report the following information:

(I) A copy of the waste shipment record for which a confirmation of delivery was not received, and

(II) A cover letter signed by the waste generator explaining the efforts taken to locate the asbestos waste shipment and the results of those efforts.

(E) Retain a copy of all waste shipment records, including a copy of the waste shipment record signed by the owner or operator of the designated waste disposal site, for at least 2 years.

(v) Furnish upon request, and make available for inspection by the Administrator, all records required under this section.

(n) Standard for Inactive Waste Disposal Sites for Manufacturing and Fabricating Operations. Each owner or operator of any inactive waste disposal site that was operated by sources covered under paragraphs (h) or (k) and received deposits of asbestos-containing waste material generated by the sources, shall meet the requirements of the Solid Waste Division of the Wyoming Department of Environmental Quality or at a minimum:

(i) Comply With One of the Following:

(A) Either discharge no visible emissions to the outside air from an inactive waste disposal site subject to the paragraph; or

(B) Cover the asbestos-containing waste material with at least 15 centimeters (6 inches) of compacted nonasbestos-containing material, and grow and maintain a cover of vegetation on the area adequate to prevent exposure of the asbestos-containing waste material. In desert areas where vegetation would be difficult to maintain, at least 8 additional centimeters (3 inches) of well-graded, nonasbestos crushed rock may be placed on top of the final cover instead of vegetation and maintained to prevent emissions; or

(C) Cover the asbestos-containing waste material with at least 60 centimeters (2 feet) of compacted nonasbestos-containing material, and maintain it to prevent exposure of the asbestos-containing waste; or

(D) For inactive waste disposal sites for asbestos tailings, a resinous or petroleum-based dust suppression agent that effectively binds dust to control surface air emissions may be used instead of the methods in paragraphs (n)(i)(A), (B), and (C). Use the agent in the manner and frequency recommended for the particular asbestos tailings by the manufacturer of the dust suppression agent to achieve and maintain dust control. Obtain prior written approval of the Administrator to use other equally effective dust suppression agents. For purposes of this paragraph, any used, spent, or other waste oil is not considered a dust suppression agent.

(ii) Unless a natural barrier adequately deters access by the general public, install and maintain warning signs and fencing as follows, or comply with paragraph (n)(i)(B) or (n)(i)(C).

(A) Display warning signs at all entrances and at intervals of 100 m (328 feet) or less along the property line of the site or along the perimeter of the sections of the site where asbestos-containing waste material was deposited. The warning signs must:

(I) Be posted in such a manner and location that a person can easily read the legend;

(II) Conform to the requirements of 51 cm x 36 cm (20" x 14") upright format signs specified in 29 CFR § 1910.145(d)(4) and this paragraph; and

(III) Display the following legend in the lower panel with letter sizes and styles of a visibility at least equal to those specified in this paragraph.

Legend
ASBESTOS WASTE DISPOSAL SITE
DO NOT CREATE DUST
Breathing Asbestos is Hazardous to Your Health

Notation
2.5 cm (1 inch) Sans Serif, Gothic or Block
1.9 cm (3/4 inch) Sans Serif, Gothic or Block
14 point Gothic

Spacing between any two lines must be at least equal to the height of the upper of the two lines.

(B) Fence the perimeter of the site in a manner adequate to deter access by the general public.

(C) When requesting a determination on whether a natural barrier adequately deters public access, supply information enabling the Administrator to determine whether a fence or a natural barrier adequately deters access by the general public.

(iii) The owner or operator may use an alternative control method that has received prior approval of the EPA Administrator rather than comply with the requirements of paragraph (n)(i) or (n)(ii).

(iv) Notify the Administrator in writing at least 45 days prior to excavating or otherwise disturbing any asbestos-containing waste material that has been deposited at a waste disposal site under this section, and follow the procedures specified in the notification. If the excavation will begin on a date other than the one contained in the original notice, notice of the new start date must be provided to the Administrator at least 10 working days before excavation begins and in no event shall excavation begin earlier than the date specified in the original notification. Include the following information in the notice:

(A) Scheduled starting and completion dates.

(B) Reason for disturbing the waste.

(C) Procedures to be used to control emissions during the excavation, storage, transport, and ultimate disposal of the excavated asbestos-containing waste material. If deemed necessary, the Administrator may require changes in the emission control procedures to be used.

(D) Location of any temporary storage site and the final disposal site.

(v) Within 60 days of a site becoming inactive and after the effective date of this subpart, record, in accordance with State law, a notation on the deed to the facility property and on any other instrument that would normally be examined during a title search; this notation will in perpetuity notify any potential purchaser of the property that:

(A) The land has been used for the disposal of asbestos-containing waste material;

(B) The survey plot and record of the location and quantity of asbestos-containing waste disposed of within the disposal site required in paragraph (q)(vi) have been filed with the Administrator; and

(C) The site is subject to Chapter 3, Section 8 of the Wyoming Air Quality Standards and Regulations and to 40 CFR part 61, Subpart M.

(o) Air Cleaning.

(i) The owner or operator who uses air cleaning, as specified in paragraphs (h)(ii)(B), (i)(iii)(C)(I)(2.)a., (i)(iii)(D)(II), (j)(ii)(B), (k)(ii)(B), (m)(i)(A)(II), (m)(i)(B)(II) and (r)(v) shall:

(A) Use fabric filter collection devices, except as noted in paragraph (o)(ii), doing all of the following:

(I) Ensuring that the airflow permeability, as determined by ASTM Method D737-04 Test Method for Air Permeability of Textile Fabrics, does not exceed $9 \text{ m}^3/\text{min}/\text{m}^2$ ($30 \text{ ft}^3/\text{min}/\text{ft}^2$) for woven fabrics or $11 \text{ m}^3/\text{min}/\text{m}^2$ ($35 \text{ ft}^3/\text{min}/\text{ft}^2$) for felted fabrics, except that $12 \text{ m}^3/\text{min}/\text{m}^2$ ($40 \text{ ft}^3/\text{min}/\text{ft}^2$) for woven and $14 \text{ m}^3/\text{min}/\text{m}^2$ ($45 \text{ ft}^3/\text{min}/\text{ft}^2$) for felted fabrics is allowed for filtering air from asbestos ore dryers;

(II) Ensuring that felted fabric weighs at least 475 grams per square meter (14 ounces per square yard) and is at least 1.6 millimeters (one-sixteenth inch) thick throughout; and

(III) Avoiding the use of synthetic fabrics that contain fill yarn other than that which is spun.

(B) Properly install, use, operate, and maintain all air-cleaning equipment authorized by this paragraph. Bypass devices may be used only during upset or emergency conditions and then only for so long as it takes to shut down the operation generating the particulate asbestos material.

(C) For fabric filter collection devices installed after January 10, 1989, provide for easy inspection for faulty bags.

(ii) There are the following exceptions to paragraph (o)(i)(A):

(A) After January 10, 1989, if the use of fabric creates a fire or explosion hazard, or the Administrator determines that a fabric filter is not feasible, the Administrator may authorize as a substitute the use of wet collectors designed to operate with a unit contacting energy of at least 9.95 kilopascals (40 inches water gage pressure).

(B) Use a HEPA filter that is certified to be at least 99.97 percent efficient for 0.3 micron particles.

(C) The EPA Administrator may authorize the use of filtering equipment other than described in paragraphs (o)(i)(A) and (o)(ii)(A) and (B) if the owner or operator demonstrates to the EPA Administrator's satisfaction that it is equivalent to the described equipment in filtering particulate asbestos material.

(p) Reporting.

(i) Any new source to which this section applies (with the exception of sources subject to paragraphs (i), (j), and (l)), which has an initial startup date preceding the effective date of this revision, shall provide the following information to the Administrator postmarked or delivered within 90 days of the effective date. In the case of a new source that does not have an initial startup date preceding the effective date, the information shall be provided, postmarked or delivered, within 90 days of the initial startup date. Any owner or operator of an existing source shall provide the following information to the Administrator within 90 days of the effective date of this subpart unless the owner or operator of the existing source has previously provided this information to the Administrator. Any changes in the information provided by any existing source shall be provided to the Administrator, postmarked or delivered, within 30 days after the change.

(A) A description of the emission control equipment used for each process; and

(I) If the fabric device uses a woven fabric, the airflow permeability in $\text{m}^3/\text{min}/\text{m}^2$ and; if the fabric is synthetic, whether the fill yarn is spun or not spun; and

(II) If the fabric filter device uses a felted fabric, the density in g/m^2 , the minimum thickness in inches and the airflow permeability in $\text{m}^3/\text{min}/\text{m}^2$.

(B) If a fabric filter device is used to control emissions,

(I) The airflow permeability in $\text{m}^3/\text{min}/\text{m}^2$ ($\text{ft}^3/\text{min}/\text{ft}^2$) if the fabric filter device uses a woven fabric, and, if the fabric is synthetic, whether the fill yarn is spun or not spun; and

(II) If the fabric filter device uses a felted fabric, the density in g/m^2 (oz/yd^2), the minimum thickness in millimeters (inches), and the airflow permeability in $\text{m}^3/\text{min}/\text{m}^2$ ($\text{ft}^3/\text{min}/\text{ft}^2$).

(C) If a HEPA filter is used to control emissions, the certified efficiency.

(D) For sources subject to paragraph (m):

(I) A brief description of each process that generates asbestos-containing waste material;

(II) The average volume of asbestos-containing waste material disposed of measured in m^3/day (yd^3/day);

(III) The emission control methods used in all stages of waste disposal; and

(IV) The type of disposal site or incineration site used for ultimate disposal, the name of the site operator, and the name and location of the disposal site.

(E) For sources subject to paragraphs (n) and (q):

(I) A brief description of the site; and

(II) The method or methods used to comply with the standard, or alternate procedures to be used.

(ii) The information required by paragraph (p)(i) must accompany the information required by 40 CFR part 61, Subpart A, § 61.10. Active waste disposal sites subject to paragraph (q) shall also comply with this provision. Demolition and renovation, spraying, and insulating materials are exempted from the requirements of 40 CFR § 61.10(a). The information described in this paragraph must be reported using the format of Appendix A of CFR 40 part 61 as a guide.

(q) Standard for Active Waste Disposal Sites. Each owner or operator of an active waste disposal site that receives asbestos-containing waste material from a source covered under paragraphs (m) or (r) shall meet the requirements of the Solid Waste Division of the Wyoming Department of Environmental Quality, or at a minimum the following:

(i) Either there must be no visible emissions to the outside air from any active waste disposal site where asbestos-containing waste material has been deposited, or the requirements of paragraph (q)(iii) or (q)(iv) must be met.

(ii) Unless a natural barrier adequately deters access by the general public, either warning signs and fencing must be installed and maintained as follows, or the requirements of paragraph (q)(iii)(A) must be met.

(A) Warning signs must be displayed at all entrances and at intervals of 100 m (330 ft) or less along the property line of the site or along the perimeter of the sections of the site where asbestos-containing waste material is deposited. The warning signs must:

(I) Be posted in such a manner and location that a person can easily read the legend;

(II) Conform to the requirements of 51 cm x 36 cm (20" x 14") upright format signs specified in 29 CFR § 1910.145(d)(4) and this paragraph; and

(III) Display the following legend in the lower panel with letter sizes and styles of a visibility at least equal to those specified below.

Legend
ASBESTOS WASTE DISPOSAL SITE
DO NOT CREATE DUST
Breathing Asbestos is Hazardous to Your Health

Notation
2.5 cm (1 inch) Sans Serif, Gothic or Block
1.9 cm (3/4 inch) Sans Serif, Gothic or Block
14 point Gothic

Spacing between any two lines must be at least equal to the height of the upper of the two lines.

(B) The perimeter of the disposal site must be fenced in a manner adequate to deter access by the general public.

(C) Upon request and supply of appropriate information, the Administrator will determine whether a fence or a natural barrier adequately deters access by the general public.

(iii) Rather than meet the no visible emission requirement of paragraph (q)(i), at the end of each operating day, or at least once every 24-hour period while the

site is in continuous operation, the asbestos-containing waste material that has been deposited at the site during the operating day or previous 24-hour period shall:

(A) Be covered with at least 15 centimeters (6 inches) of compacted nonasbestos-containing material, or

(B) Be covered with a resinous or petroleum-based dust suppression agent that effectively binds dust and controls wind erosion. Such an agent shall be used in the manner and frequency recommended for the particular dust by the dust suppression agent manufacturer to achieve and maintain dust control. Other equally effective dust suppression agents may be used upon prior approval by the Administrator. For purposes of this paragraph, any used, spent, or other waste oil is not considered a dust suppression agent.

(iv) Rather than meet the no visible emission requirement of paragraph (q)(i), use an alternative emissions control method that has received prior written approval by the EPA Administrator.

(v) For all asbestos-containing waste material received, the owner or operator of the active waste disposal site shall:

(A) Maintain waste shipment records, using a form similar to that shown in Figure 4, and include the following information:

(I) The name, address, and telephone number of the waste generator.

(II) The name, address, and telephone number of the transporter(s).

(III) The quantity of the asbestos-containing waste material in cubic meters (cubic yards).

(IV) The presence of improperly enclosed or uncovered waste, or any asbestos-containing waste material not sealed in leak-tight containers.

(V) The date of the receipt.

(B) Upon discovering the presence of a significant amount of improperly enclosed or uncovered waste, report in writing by the following working day to the local, State, or EPA Regional office responsible for administering the asbestos NESHAP program for the waste generator (identified in the waste shipment record), and, if that office is outside the State of Wyoming, also report in writing by the following working day to the Wyoming Department of Environmental Quality, Air Quality Division. Submit a copy of the waste shipment record along with the report.

(C) As soon as possible and no longer than 30 days after receipt of the waste, send a copy of the signed waste shipment record to the waste generator.

(D) Upon discovering a discrepancy between the quantity of waste designated on the waste shipment records and the quantity actually received, attempt to reconcile the discrepancy with the waste generator. If the discrepancy is not resolved within 15 days after receiving the waste, immediately report in writing to the local, State, or EPA Regional office responsible for administering the asbestos NESHAP program for the waste generator (identified in the waste shipment record), and, if that office is outside the State of Wyoming, also report in writing to the Wyoming Department of Environmental Quality, Air Quality Division. Describe the discrepancy and attempts to reconcile it, and submit a copy of the waste shipment record along with the report.

(E) Retain a copy of all records and reports required by this paragraph for at least 2 years.

(vi) Maintain, until closure, records of the location, depth and area, and quantity in cubic meters (cubic yards) of asbestos-containing waste material within the disposal site on a map or diagram of the disposal area.

(vii) Upon closure, comply with all the provisions of paragraph (n).

(viii) Submit to the Administrator, upon closure of the facility, a copy of records of asbestos waste disposal locations and quantities.

(ix) Furnish upon request, and make available during normal business hours for inspection by the Administrator, all records required under this paragraph.

(x) Notify the Administrator in writing at least 45 days prior to excavating or otherwise disturbing any asbestos-containing waste material that has been deposited at a waste disposal site and is covered. If the excavation will begin on a date other than the one contained in the original notice, notice of the new start date must be provided at least 10 working days before excavation begins and in no event shall excavation begin earlier than the date specified in the original notification. Include the following information in the notice.

(A) Scheduled starting and completion dates.

(B) Reason for disturbing the waste.

(C) Procedures to be used to control emissions during the excavation, storage, transport, and ultimate disposal of the excavated asbestos-containing waste material. If deemed necessary, the Administrator may require changes in the emission control procedures to be used.

(D) Location of any temporary storage site and the final disposal site.

(r) Standard for Operations That Convert Asbestos-Containing Waste Material Into Nonasbestos (Asbestos-Free) Material. Each owner or operator of an operation that converts RACM and asbestos-containing waste material into nonasbestos (asbestos-free) material shall:

(i) Obtain the prior written approval of the EPA Administrator to construct the facility. To obtain approval, the owner or operator shall provide the EPA Administrator with the following information:

(A) Application to construct pursuant to 40 CFR § 61.07.

(B) In addition to the information requirements of 40 CFR § 61.07(b)(3), a

(I) Description of waste feed handling and temporary storage.

(II) Description of process operating conditions.

(III) Description of the handling and temporary storage of the end product.

(IV) Description of the protocol to be followed when analyzing output materials by transmission electron microscopy.

(C) Performance test protocol, including provisions for obtaining information required under paragraph (r)(ii).

(D) The EPA Administrator may require that a demonstration of the process be performed prior to approval of the application to construct.

(ii) Conduct a Start-up Performance Test. Test Results Shall Include:

(A) A detailed description of the types and quantities of nonasbestos material, RACM, and asbestos-containing waste material processed, e.g., asbestos cement products, friable asbestos insulation, plaster, wood, plastic, wire, etc. Test feed is to include the full range of materials that will be encountered in actual operation of the process.

(B) Results of analyses, using polarized light microscopy, that document the asbestos content of the wastes processed.

(C) Results of analyses, using transmission electron microscopy, that document that the output materials are free of asbestos. Samples for analysis are to be collected as 8-hour composite samples (one 200-gram (7-ounce) sample per hour), beginning with the initial introduction of RACM or asbestos-containing waste material and continuing until the end of the performance test.

(D) A description of operation parameters, such as temperature and residence time, defining the full range over which the process is expected to operate to produce nonasbestos (asbestos-free) materials. Specify the limits for each operating parameter within which the process will produce nonasbestos (asbestos-free) materials.

(E) The length of the test.

(iii) During the initial 90 days of operation,

(A) Continuously monitor and log the operating parameters identified during start-up performance tests that are intended to ensure the production of nonasbestos (asbestos-free) output material.

(B) Monitor input materials to ensure that they are consistent with the test feed materials described during start-up performance tests in paragraph (r)(ii)(A).

(C) Collect and analyze samples, taken as 10-day composite samples (one 200-gram (7-ounce) sample collected every 8 hours of operation) of all output material for the presence of asbestos. Composite samples may be for fewer than 10 days. Transmission electron microscopy (TEM) shall be used to analyze the output material for the presence of asbestos. During the initial 90-day period, all output materials must be stored on-site until analysis shows the material to be asbestos-free or disposed of as asbestos-containing waste material according to paragraph (m).

(iv) After the initial 90 days of operation,

(A) Continuously monitor and record the operating parameters identified during start-up performance testing and any subsequent performance testing. Any output produced during a period of deviation from the range of operating conditions established to ensure the production of nonasbestos (asbestos-free) output materials shall be:

(I) Disposed of as asbestos-containing waste material according to paragraph (m), or

(II) Recycled as waste feed during process operation within the established range of operation conditions, or

(III) Stored temporarily on-site in a leak-tight container until analyzed for asbestos content. Any product material that is not asbestos-free shall be either disposed of as asbestos-containing waste material or recycled as waste feed to the process.

(B) Collect and analyze monthly composite samples (one 200-gram (7-ounce) sample collected every 8 hours of operation) of the output material. Transmission electron microscopy shall be used to analyze the output material for the presence of asbestos.

(v) Discharge no visible emissions to the outside air from any part of the operation, or use the methods specified in paragraph (o) to clean emissions containing particulate asbestos material before they escape to, or are vented to, the outside air.

(vi) Maintain Records On-site and Include the Following Information:

(A) Results of start-up performance testing and all subsequent performance testing, including operating parameters, feed characteristic, and analyses of output materials.

(B) Results of the composite analyses required during the initial 90 days of operation under paragraph (r)(iii).

(C) Results of the monthly composite analyses required under paragraph (r)(iv).

(D) Results of continuous monitoring and logs of process operating parameters required under paragraph (r)(iii) and (iv).

(E) The information on waste shipments received as required in paragraph (q).

(F) For output materials where no analyses were performed to determine the presence of asbestos, record the name and location of the purchaser or disposal site to which the output materials were sold or deposited, and the date of sale or disposal.

(G) Retain records required by paragraph (r)(vi) for at least 2 years.

(vii) Submit the Following Reports to the Administrator:

(A) A report for each analysis of product composite samples performed during the initial 90 days of operation.

(B) A quarterly report, including the following information concerning activities during each consecutive 3-month period:

(I) Results of analyses of monthly product composite samples.

(II) A description of any deviation from the operating parameters established during performance testing, the duration of the deviation, and steps taken to correct the deviation.

(III) Disposition of any product produced during a period of deviation, including whether it was recycled, disposed of as asbestos-containing waste material, or stored temporarily on-site until analyzed for asbestos content.

(IV) The information on waste disposal activities as required in paragraph (q).

(viii) Nonasbestos (asbestos-free) output material is not subject to any of the provisions of this section. Output materials in which asbestos is detected, or output materials produced when the operating parameters deviated from those established during the start-up performance testing, unless shown by TEM analysis to be asbestos-free, shall be considered to be asbestos-containing waste and shall be handled and disposed of according to paragraphs (m) and (q) or reprocessed while all of the established operating parameters are being met.

Section 9. **Incorporation by reference.**

(a) Code of Federal Regulations (CFR). All Code of Federal Regulations (CFR), including their Appendices, cited in this Chapter, revised and published as of July 1, ~~2006~~ 2008, not including any later amendments, are incorporated by reference. Copies of the Code of Federal Regulations are available for public inspection and copies can be obtained at cost from the Department of Environmental Quality, Division of Air Quality, 122 W. 25th Street, Cheyenne, Wyoming 82002. Copies of the CFRs can also be obtained at cost from Government Institutes, 15200 NBN Way, Building B, Blue Ridge Summit, PA 17214.

(b) American Society for Testing and Materials (ASTM). All ASTM standards cited in this Chapter, revised and published as of July 1, ~~2006~~ 2008, not including any later amendments, are incorporated by reference. Copies of the ASTM standards are available for public inspection and copies can be obtained at cost from the Department of Environmental Quality, Division of Air Quality, 122 W. 25th Street, Cheyenne, Wyoming 82002. Copies can also be obtained at cost from the American Society for Testing and Materials, 100 Barr Harbor Drive, Post Office Box C700, West Conshohocken, PA 19428-2959.

**WYOMING DEPARTMENT OF ENVIRONMENTAL QUALITY
AIR QUALITY DIVISION
STANDARDS AND REGULATIONS**

General Emission Standards

CHAPTER 3

Section 1. Introduction to general emission standards.

(a) This Chapter establishes limits on the quantity, rate, or concentration of emissions of air pollutants, including any requirements which limit the level of opacity, prescribe equipment, set fuel specifications, or prescribe operation or maintenance procedures. These general emission standards may be superseded by specific emission standards required in other Chapters of the Wyoming Air Quality Standards and Regulations. Section 9 incorporates by reference all Code of Federal Regulations (CFRs), including their Appendices, cited in this Chapter and all American Society for Testing and Materials (ASTM) standards cited in this Chapter.

Section 2. Emission standards for particulate matter.

(a) Visible emissions of any contaminant discharged into the atmosphere from any single new source of emission whatsoever as determined by a qualified observer shall be limited to 20 percent opacity;

Provided, however, that:

(i) An owner or operator of an affected facility of the type described in Chapter 3, Section 2(h)(i) hereof which has a heat input of not less than 2500×10^6 Btu per hour, may request the Administrator of the Division of Air Quality to determine opacity of emissions from such affected facility during initial performance tests required by Chapter 3, Section 2(i) or during other performance tests thereafter.

(ii) Upon receipt from such owner or operator of the written report of the results of the performance tests required by Chapter 6, Section 2(i) or later performance tests, the Administrator will make a finding concerning compliance with opacity and other applicable standards. If the Administrator finds that such affected facility is in compliance with all applicable standards for which performance tests are conducted but fails to meet any applicable opacity standard, he shall notify the owner or operator and advise him that he may petition the Administrator within 10 days of receipt of notification to make appropriate adjustment to the opacity standard for such affected facility.

(iii) The Administrator will grant such a petition upon a satisfactory demonstration by the owner or operator that such affected facility and associated air pollution control equipment was operated and maintained in a manner to minimize the

opacity of emissions during the performance tests; that the performance tests were performed under the conditions prescribed by the Administrator; and that such affected facility and associated air pollution control equipment were incapable of being adjusted or operated to meet the applicable opacity standard at or near the facility's designed capacity.

(iv) The Administrator will establish an opacity standard for such affected facility meeting the above requirements at a level at which the source will be able, as indicated by the performance and opacity tests, to meet the opacity standard at all times during which the source is meeting the mass or concentration emission standard and during which the facility and air pollution equipment is being operated properly and maintained to minimize the opacity of emissions and mass emission rate.

(b) Visible emissions of any contaminant discharged into the atmosphere from any single existing source of emission whatsoever as determined by a qualified observer shall be limited to 40 percent opacity. This limitation shall not apply to existing incinerators or wood waste burners.

(c) The emissions of visible air pollutants from gasoline engines shall be eliminated except for periods not exceeding five consecutive seconds.

(d) The emissions of visible air pollutants from diesel engines as determined by a qualified observer shall be limited to 30 percent opacity below 7500 feet elevation except for periods not exceeding ten consecutive seconds. This limitation shall not apply during a reasonable period of warm-up following a cold start or where undergoing repairs and adjustment following a malfunction.

(e) Unless restricted by more stringent emission limits established elsewhere in the Wyoming Air Quality Standards and Regulations or permit conditions, any single source may discharge for a period or periods aggregating not more than 6 minutes in any hour contaminants;

(i) Having an equivalent opacity of not more than 40 percent as determined by a qualified observer.

(f) Fugitive Dust. Sources operating within the State of Wyoming are required to control fugitive dust emissions. The following control measures or any equivalent method approved by the Division Administrator shall be considered appropriate for minimizing fugitive dust:

(i) Construction/Demolition Activities.

(A) Any person engaged in clearing or leveling of land, earthmoving, excavation, or movement of trucks or construction equipment over access

haul roads or cleared land shall take steps to minimize fugitive dust from such activities. Such control measures may include frequent watering and/or chemical stabilization.

(B) Any person engaged in demolition activities including razing of homes, buildings, or other structures; or removing paving material from roads and/or parking areas shall take steps to minimize fugitive dust from such activities. Such control measures may include frequent watering and/or chemical stabilization.

(C) Any person who is engaged in construction or demolition activities which tracks earth or other materials onto paved streets shall promptly remove such material by water or other means.

(D) Any person engaged in sandblasting or similar operations shall take steps to minimize fugitive dust from such activities. Such control measures may include the installation and use of hood, fans and fabric filters to enclose and vent the handling of dusty materials.

(ii) Handling and Transporting of Materials.

(A) Any person owning, operating or maintaining a new or existing material storage, handling and/or hauling operation shall minimize fugitive dust from such an operation. Such control measures may include the application of asphalt, oil, water or suitable chemicals on unpaved roads, material stockpiles and other surfaces which can give rise to airborne dusts. Control measures for material handling may also include installation and use of hoods, fans and fabric filters to enclose and vent dusty materials.

(B) When transporting materials likely to give rise to airborne dust, open bodied trucks shall be covered when in motion.

(iii) Agricultural Practices.

(A) Any person engaged in agricultural practices, such as tilling of land and application of fertilizers shall operate in a manner as to minimize fugitive dust emissions.

(g) The emission of particulate matter from any new source shall be limited as indicated in Table I. The emission of particulate matter from any existing source shall be limited as indicated in Table II.

(i) Process weight per hour means the total weight of all materials introduced into any specific process that may cause any emissions of particulate matter, including solid fuels, but excluding liquids or gases and used solely as fuels, and excluding air introduced for purposes of combustion, and excluding the weight of any water, water vapor or steam that may be introduced as part of the total materials.

However, water contained as part of the normal input to a beet pulp dryer process shall be included as part of the process weight per hour. The process weight rate per hour referred to in this section shall be based upon the maximum design production rate of the equipment unless otherwise restricted by enforceable limits on potential to emit.

(ii) For a cyclical or batch operation, the process weight per hour is derived by dividing the total process weight by the number of hours in one complete operation from the beginning of any given process to the completion thereof, excluding any time during which the equipment is idle.

(iii) For a continuous operation, the process weight per hour is derived by dividing the process weight for a typical period of time.

(iv) Emission tests related to this regulation shall be measured in accordance with the requirements of Chapter 3, Section 2(h)(iv).

TABLE I	
PROCESS WEIGHT RATE (lbs/hr)	EMISSION RATE (lbs/hr)
50	0.36
100	0.55
500	1.53
1,000	2.25
5,000	6.34
10,000	9.73
20,000	14.99
60,000	29.60
80,000	31.19
120,000	33.28
160,000	34.85
200,000	36.11
400,000	40.35
1,000,000	46.72

Interpolation of the data in Table I for the process weight rates up to 60,000 lbs/hr shall be accomplished by the use of the equation:

$$E = 3.59 P^{0.62} \quad P \leq 30 \text{ tons/hr}$$

and interpolation and extrapolation of the data for process weight rates in excess of 60,000 lbs/hr shall be accomplished by use of the equation:

$$E = 17.31 P^{0.16} \quad P > 30 \text{ tons/hr}$$

Where: E = Emissions in pounds per hour.
P = Process weight rate in tons per hour.

TABLE II					
PROCESS WEIGHT RATE		RATE OF EMISSION	PROCESS WEIGHT RATE		RATE OF EMISSION
lb/hr	tons/hr	lb/hr	lb/hr	tons/hr	lb/hr
100	0.05	0.551	16,000	8	16.5
200	0.10	0.877	18,000	9	17.9
400	0.20	1.40	20,000	10	19.2
600	0.30	1.83	30,000	15	25.2
800	0.40	2.22	40,000	20	30.5
1,000	0.50	2.58	50,000	25	35.4
1,500	0.75	3.38	60,000	30	40.0
2,000	1.00	4.10	70,000	35	41.3
2,500	1.25	4.76	80,000	40	42.5
3,000	1.50	5.38	90,000	45	43.6
3,500	1.75	5.96	100,000	50	44.6
4,000	2.00	6.52	120,000	60	46.3
5,000	2.50	7.58	140,000	70	47.8
6,000	3.00	8.56	160,000	80	49.0
7,000	3.50	9.49	200,000	100	51.2
8,000	4.00	10.4	1,000,000	500	69.0
9,000	4.50	11.2	2,000,000	1,000	77.6
10,000	5.00	12.0	6,000,000	3,000	92.7
12,000	6.00	13.6			

Interpolation of the data in Table II for process weight rates up to 60,000 lb/hr shall be accomplished by use of the equation $E = 4.10 P^{0.67}$, and interpolation and extrapolation of the data for process weight rates in excess of 60,000 lb/hr shall be accomplished by use of the equation:

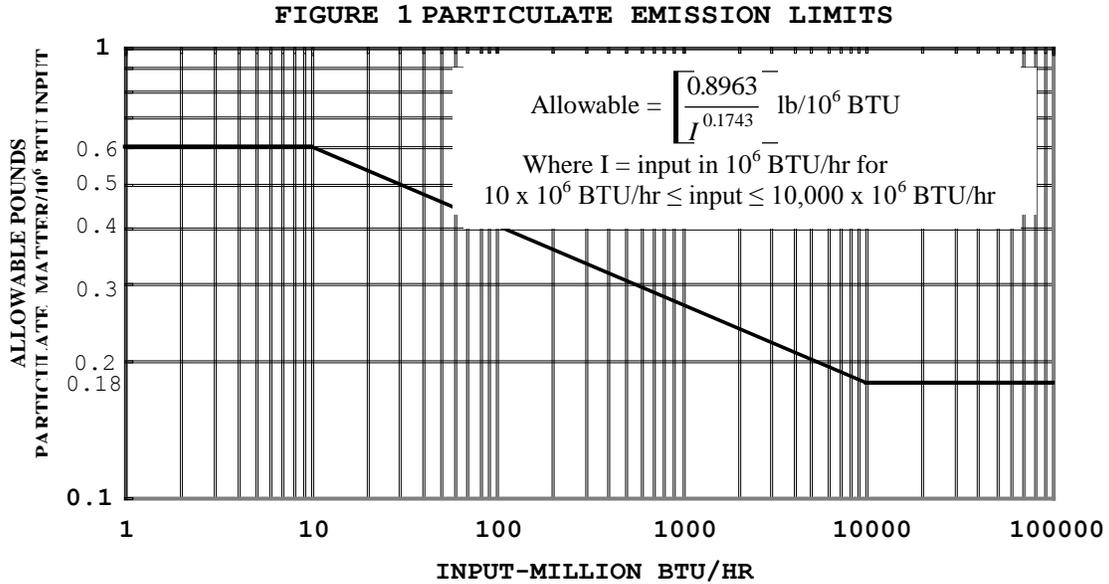

$$E = 55.0 P^{0.11} - 40, \text{ where } E = \text{rate of emission in lb/hr}$$

and P = process weight rate in tons/hr

Notwithstanding any other provision of this Table, any existing air contaminant source utilizing an air pollution control device having a collection efficiency of 99.5 percent or better, shall be deemed to be in compliance with all provisions of this

regulation. Such efficiency shall be determined by a professional engineer licensed to practice in Wyoming and all expenses incurred in such determination shall be defrayed by the person responsible for the emission.

(h) The emissions of particulate matter from existing sources where fuel burning equipment is used for indirect heating shall be limited as shown in Figure 1 and shall be applicable to equipment burning solid fuel.

The emissions of particulate matter from new sources where fuel burning equipment is used for indirect heating shall be limited to 0.10 pound per million Btu input (0.18 grams per million calories) maximum 2-hour average. Except to the extent that an opacity standard has been established for an affected facility pursuant to Chapter 3, Section 2(a)(i) through (iv) hereof, the visible emissions of particulate matter from new sources where fuel burning equipment is used for indirect heating shall be no greater than 20 percent opacity, except that 40 percent opacity shall be permitted for not more than 2 minutes in any hour. This regulation is not applicable to residential or commercial fuel burning equipment with a heat input of less than 10×10^6 Btu/hr and used exclusively to produce building heat.

(i) This regulation applies to installations in which fuel is burned for the primary purpose of producing steam, hot water, or hot air or other indirect heating of liquids, gases, or solids, and, in the course of doing so, the products of combustion do not come into direct contact with process materials. Fuels include those such as coal, coke, lignite, fuel oil, and wood, but do not include refuse. When any products or byproducts of a manufacturing process are burned for the same purpose or in conjunction with any fuel, the same maximum emission limitations shall apply.

(ii) For purposes of this regulation, the heat input shall be the aggregate heat content of all fuels whose products of combustion pass through a stack or stacks, or the heat input value used shall be the equipment manufacturer or designer's guaranteed maximum input, whichever is greater. The total heat input of all fuel burning units at a plant or on a premise shall be used for determining the maximum allowable amount of particulate matter which may be emitted.

(iii) The amount of particulate matter emitted shall be measured by test Methods 1 through 5, Appendix A, 40 CFR part 60. Provided that the Administrator may require that variations to said methods be included or that entirely different methods be utilized if he determines that such variations or different methods are necessary in order for the test data to reflect the actual emission rate of particulate matter.

(i) The emission of particulate matter from any incinerator shall be limited to:

(i) 0.20 pound per 100 pounds (2 grams per kilogram) of refuse charged as determined by a source test method approved by the Division for stationary sources as described in Section 2(h)(ii) of this Chapter;

(ii) A shade or density equal to but not greater than 20 percent opacity as determined by a qualified observer.

Section 3. **Emission standards for nitrogen oxides.**

(a) The emission standards for nitrogen oxides, measured in accordance with Method 7 of 40 CFR part 60, Appendix A or by an equivalent method are:

(i) The emission of nitrogen oxides from new gas fired fuel burning equipment calculated as nitrogen dioxide shall be limited to 0.20 pound per million Btu (0.36 grams per million gram calories) of heat input.

(ii) The emission of nitrogen oxides from existing gas fired fuel burning equipment calculated as nitrogen dioxide shall be limited to 0.23 pound per million Btu (0.41 grams per million gram calories) of heat input.

(iii) The emission of nitrogen oxides from new oil fired fuel burning equipment calculated as nitrogen dioxide shall be limited to 0.30 pounds per million Btu (0.54 grams per million gram calories) of heat input for units having a heat input of 1.0 million Btu per hour (250 million gram calories/hour) or greater and 0.60 pounds per million Btu (1.08 grams per million gram calories) of heat input for units having a heat input less than 1.0 million Btu per hour (250 million gram calories/hour).

(iv) The emission of nitrogen oxides from existing oil fired fuel burning equipment calculated as nitrogen dioxide shall be limited to 0.46 pound per million Btu (0.83 grams per million gram calories) of heat input for units having a heat input of 250

million Btu per hour (62.5 billion gram calories/hour) or greater and 0.60 pound per million Btu (1.08 grams per million gram calories) of heat input for units having a heat input less than 250 million Btu per hour (62.5 billion gram calories/hour).

(v) The emission of nitrogen oxides from new nitric acid manufacturing plants, calculated as nitrogen dioxide shall be limited to 3 pounds per ton (1.5 kilograms per metric ton) of acid produced, maximum 2-hour average.

(vi) The emission of nitrogen oxides from new solid fossil fuel (except lignite) fired fuel burning equipment calculated as nitrogen dioxide shall be limited to 0.70 pounds per million Btu (1.26 grams per million gram calories) heat input.

(vii) The emission of nitrogen oxides from existing solid fossil fuel (except lignite) fired fuel burning equipment calculated as nitrogen dioxide shall be limited to 0.75 pounds per million Btu (1.35 grams per million gram calories) heat input.

(viii) The requirements of Chapter 3, Section 3(a) shall not apply to internal combustion engines having a heat input of less than 200 million Btu per hour.

Section 4. **Emission standards for sulfur oxides.**

(a) Any new facility producing sulfuric acid by the contact process by burning elemental sulfur, alkylation acid, hydrogen sulfide, organic sulfides, mercaptans, or acid sludge shall limit the atmospheric discharge of sulfur dioxide in the effluent to not more than four pounds per ton of acid produced (2 kgm per metric ton)--maximum 2-hour average.

(b) The emission of sulfur dioxide (SO₂) from fuel-burning equipment, the construction of which commences on or after January 1, 1985, shall be limited to the values shown in Table 4a. Compliance with these emission limitations shall be determined on a 30-day rolling average basis and a fixed 3-hour basis, using the emission data obtained from an SO₂ continuous monitoring system installed and operated in accordance with Chapter 5, Section 2(j) of these regulations.

(i) Compliance with the 30-day rolling average shall be determined by calculating the arithmetic average of all hourly SO₂ emission rates for the most recent 30 successive operating days, except for data obtained during operation under Chapter 1, Section 5 of these regulations.

(A) The initial performance test period shall consist of the first 30 days of operation of the fuel burning equipment. Using the most recent 30 days of operation of the fuel burning equipment, a new 30-day average compliance determination for SO₂ is calculated for each successive operating day. These determinations will each constitute a separate performance test.

(B) For the purpose of calculating 30-day average emissions, the minimum amount of emissions data required is 75 percent of the operating hours during each operating day in at least 22 out of 30 successive operating days. A minimum of two data points are required to calculate each one-hour average. If, during any 30-day period, the minimum amount of emission data is not obtained because of continuous monitoring system breakdowns, repairs, calibration checks, or zero and span adjustments, the owner or operator of the continuous monitoring system must notify the Administrator pursuant to Chapter 3, Section 4(b)(iii) of the cause(s) for such loss of data and must immediately initiate corrective action necessary to resume acceptable performance of the continuous monitoring system.

(ii) Compliance with the 3-hour SO₂ emission rate shall be determined for fixed 3-hour periods and shall use all hourly SO₂ emission rates including data obtained during periods of operation under Chapter 3, Section 4(b)(iii) and excluding periods of operation under Chapter 1, Section 5 of these regulations. The maximum 3-hour SO₂ emission rate is not to be exceeded more than once per calendar year.

(iii) The owner or operator shall, within 3 hours of malfunction or failure of the continuous emission monitors to operate, notify the Administrator of such malfunction or failure and shall utilize such alternate monitoring methods as may be required by the Administrator during such period. Emission rate data gathered during such periods pursuant to the alternate methods required by the Administrator shall be used in the determination of compliance with the 30-day rolling average value and the 3-hour value.

TABLE 4a		
TYPE OF FUEL	ALLOWABLE SO₂ EMISSION RATE⁽¹⁾ (lb/10⁶ Btu Heat Input)	
	30-DAY ROLLING AVG.	MAXIMUM 3-HR AVG.
COAL	0.2	0.45
OIL	0.8	0.8

⁽¹⁾ Applicable to individual fuel burning equipment units with a heat input of 250 x 10⁶ Btu/hr or greater.

(c) The emission of sulfur dioxide (SO₂) from fuel-burning equipment, the construction of which commenced after January 1, 1974 and prior to January 1, 1985, shall be limited to the 30-day rolling average values shown in Table 4a, calculated on the basis of a 2-hour average.

Provided, however, that the owner or operator of any facility subject to the compliance provisions of this section may elect by written notice to the Administrator, to be subject to the compliance provisions of Chapter 3, Section 4(b) of these regulations. Thirty days after such notification, the emission limitations and compliance determination

methods and provisions of Chapter 3, Section 4(b), in their entirety, shall become applicable and binding upon such facility.

(d) The emission of sulfur dioxide (SO₂) from fuel burning equipment, the construction of which commenced prior to January 1, 1974, shall be limited to the values shown in Table 4b, calculated on the basis of 2-hour averages or an equivalent method.

For the purpose of this section, operation of a continuous SO₂ emission monitoring system and the calculation of emission rates on the basis of 30-day rolling averages with a maximum 3-hour emission rate shown in Table 4c, when conducted in accordance with Chapter 3, Section 4(b) and Chapter 5, Section 2(j) of these regulations, is an equivalent method for determining compliance with the emission limitations specified in Table 4b. Upon written notice to the Administrator, the owner or operator of any facility that is subject to the compliance provisions of this section may elect the use of continuous emission monitoring systems with a 30-day averaging and maximum 3-hour emission rate as an equivalent method. Thirty days after such notification, the compliance determination method provision of Chapter 3, Section 4(b) shall become applicable and binding upon such facility.

TABLE 4B			
ALLOWABLE SO₂ EMISSION RATE⁽²⁾			
(LB/10⁶ BTU HEAT INPUT)			
FUEL	HEAT INPUT BETWEEN 250x10⁶ BTU/HR & 2500x10⁶ BTU/HR	HEAT INPUT BETWEEN 2500x10⁶ BTU/HR & 5000x10⁶ BTU/HR	HEAT INPUT GREATER THAN 5000x10⁶ BTU/HR
COAL	1.2	0.5	0.3

⁽²⁾ Applicable to individual fuel burning equipment units with the noted heat input values.

TABLE 4C				
ALLOWABLE SO₂ EMISSION RATE⁽³⁾				
(LB/10⁶ BTU HEAT INPUT)				
FUEL	AVERAGING PERIOD	HEAT INPUT BETWEEN 250x10⁶ BTU/HR & 2500x10⁶ BTU/HR	HEAT INPUT BETWEEN 2500x10⁶ BTU/HR & 5000x10⁶ BTU/HR	HEAT INPUT GREATER THAN 5000x10⁶ BTU/HR
COAL	30-DAY ROLLING	1.2	0.5	0.3
COAL	3-HOUR FIXED ⁽⁴⁾	1.2	1.2	0.65

⁽³⁾ Applicable to individual fuel burning equipment units with the noted heat input values.

⁽⁴⁾ Not to be exceeded more than once per year.

(e) For purposes of Chapter 3, Section 4(b), 4(c), and 4(d) of these regulations, the heat input shall be the aggregate heat content of all fuels whose products of combustions pass through a stack or stacks, or the heat input value used shall be the equipment manufacturer's or designer's guaranteed maximum input, whichever is greater.

(f) For the purposes of Chapter 3, Section 4(b), 4(c), and 4(d) of these regulations where a two-hour average, or a 3-hour average will be used, the SO₂ emission rate shall be determined in accordance with Reference Method 6, Appendix A, 40 CFR part 60 or an equivalent method or in accordance with the compliance provisions of Chapter 3, Section 4(b), if the notification provisions of 4(c) and 4(d) are followed.

Section 5. **Emission standards for carbon monoxide.**

(a) The emission of carbon monoxide in stack gases from any stationary source shall be limited as may be necessary to prevent ambient standards described in Chapter 2, Section 5 from being exceeded. Measures considered appropriate for such control are:

(i) Treatment of the waste gas stream by installation and use of a direct flame afterburner or other means which will achieve the required reduction as approved by the Division.

Section 6. **Emission standards for volatile organic compounds.**

(a) The term "*volatile organic compounds*" (*VOCs*) is defined in 40 CFR § 51.100(s), 51.100(s)(1), and 51.100(s)(5), incorporated by reference under Section 9(a) of this chapter.

(b) VOC emissions shall be limited through the application of Best Available Control Technology (BACT) in accordance with Chapter 6, Section 2 of these regulations. Notwithstanding the above, whenever acceptable control of VOC emissions from vapor blowdown, emergency relief systems, or VOC emissions generated from oil and gas production, storage, exploration, development, or processing operations is specified pursuant to these regulations as a flare, the flare shall not exceed a 20 percent opacity emission standard. If acceptable control of VOC emissions is specified as a smokeless flare, the definition given in subsection (i) of this section applies.

(i) For the purposes of this section, "*smokeless flare*" means a flare designed for and operated with no visible emissions except for periods not to exceed a total of 5 minutes during any 2 consecutive hours.

(ii) Each flare subject to Chapter 3, Section 6(b) must be equipped and operated with an automatic igniter or a continuous burning pilot which must be maintained in good working order.

Section 7. **Emission standards for hydrogen sulfide.**

(a) Any exit process gas stream containing hydrogen sulfide which is discharged to the atmosphere from any source shall be vented, incinerated, flared or otherwise disposed of in such a manner that ambient sulfur dioxide and hydrogen sulfide standards described in Chapter 2, Sections 4 and 7 are not exceeded.

Section 8. **Emission standards of asbestos for demolition, renovation, manufacturing, spraying and fabricating.**

(a) Applicability. The provisions of this section are applicable to those sources specified in paragraphs (g) through (n), (q), and (r).

(b) Definitions. All terms that are used in this section and are not defined below are given the same meaning as in Chapter 1, Section 3 of these regulations.

“Active waste disposal site” means any disposal site other than an inactive site.

“Adequately wet” means sufficiently mix or penetrate with liquid to prevent the release of particulates. If visible emissions are observed coming from asbestos-containing material, then that material has not been adequately wetted. However, the absence of visible emissions is not sufficient evidence of being adequately wet.

“Asbestos” means the asbestiform varieties of serpentinite (chrysotile), riebeckite (crocidolite), cummingtonite-grunerite, anthophyllite, and actinolite-tremolite.

“Asbestos-containing waste materials” means mill tailings or any waste that contains commercial asbestos and is generated by a source subject to the provisions of this section. This term includes filters from control devices, friable asbestos waste material, and bags or other similar packaging contaminated with commercial asbestos. As applied to demolition and renovation operations, this term also includes regulated asbestos-containing material waste and materials contaminated with asbestos including disposable equipment and clothing.

“Asbestos tailings” means any solid waste that contains asbestos and is a product of asbestos mining or milling operations.

“Asbestos waste from control devices” means any waste material that contains asbestos and is collected by a pollution control device.

“Category I nonfriable asbestos-containing material (ACM)” means asbestos-containing packings, gaskets, resilient floor covering, and asphalt roofing

products containing more than 1 percent asbestos as determined using the method specified in Appendix J to 29 CFR § 1910.1001, Polarized Light Microscopy of Asbestos.

“Category II nonfriable ACM” means any material, excluding Category I nonfriable ACM, containing more than 1 percent asbestos as determined using the methods specified in Appendix J to 29 CFR § 1910.1001, Polarized Light Microscopy of Asbestos that, when dry, cannot be crumbled, pulverized, or reduced to powder by hand pressure.

“Commercial asbestos” means any material containing asbestos that is extracted from ore and has value because of its asbestos content.

“Cutting” means to penetrate with a sharp-edged instrument and includes sawing, but does not include shearing, slicing, or punching.

“Demolition” means the wrecking or taking out of any load-supporting structural member of a facility together with any related handling operations or the intentional burning of any facility.

“Emergency renovation operation” means a renovation operation that was not planned but results from a sudden, unexpected event that, if not immediately attended to, presents a safety or public health hazard, is necessary to protect equipment from damage, or is necessary to avoid imposing an unreasonable financial burden. This term includes operations necessitated by nonroutine failures of equipment.

“Fabricating” means any processing (e.g., cutting, sawing, drilling) of a manufactured product that contains commercial asbestos, with the exception of processing at temporary sites (field fabricating) for the construction or restoration of facilities. In the case of friction products, fabricating includes bonding, debonding, grinding, sawing, drilling, or other similar operations performed as part of fabricating.

“Facility” means any institutional, commercial, public, industrial, or residential structure, installation, or building (including any structure, installation, or building containing condominiums or individual dwelling units operated as a residential cooperative, but excluding residential buildings having four or fewer dwelling units); any ship; and any active or inactive waste disposal site. For the purposes of this definition, any building, structure, or installation that contains a loft used as a dwelling is not considered a residential structure, installation, or building. Any structure, installation or building that was previously subject to this section is not excluded, regardless of its current use or function.

“Facility component” means any part of a facility including equipment.

“Friable asbestos material” means any material containing more than 1 percent asbestos as determined using the method specified in Appendix J to 29 CFR §

1910.1001, Polarized Light Microscopy of Asbestos, that, when dry, can be crumbled, pulverized, or reduced to powder by hand pressure. If the asbestos content is less than 10 percent as determined by a method other than point counting by polarized light microscopy (PLM), verify the asbestos content by point counting using PLM.

“Fugitive source” means any source of emissions not controlled by an air pollution control device.

“Glove bag” means a sealed compartment with attached inner gloves used for the handling of asbestos-containing materials. Properly installed and used, glove bags provide a small work area enclosure typically used for small-scale asbestos stripping operations. Information on glove-bag installation, equipment and supplies, and work practices is contained in the Occupational Safety and Health Administration’s (OSHA’s) final rule on occupational exposure to asbestos (29 CFR § 1926.1101(g)(5)(ii)).

“Grinding” means to reduce to powder or small fragments and includes mechanical chipping or drilling.

“In poor condition” means the binding of the material is losing its integrity as indicated by peeling, cracking, or crumbling of the material.

“Inactive waste disposal site” means any disposal site or portion of it where additional asbestos-containing waste material has not been deposited within the past year.

“Installation” means any building or structure or any group of buildings or structures at a single demolition or renovation site that are under the control of the same owner or operator (or owner or operator under common control).

“Leak-tight” means that solids or liquids cannot escape or spill out. It also means dust-tight.

“Malfunction” means any sudden and unavoidable failure of air pollution control equipment or process equipment or of a process to operate in a normal or usual manner so that emissions of asbestos are increased. Failures of equipment shall not be considered malfunctions if they are caused in any way by poor maintenance, careless operation, or any other preventable upset conditions, equipment breakdown, or process failure.

“Manufacturing” means the combining of commercial asbestos--or, in the case of woven friction products, the combining of textiles containing commercial asbestos--with any other material(s), including commercial asbestos, and the processing of this combination into a product. Chlorine production is considered a part of manufacturing.

“Natural barrier” means a natural object that effectively precludes or deters access. Natural barriers include physical obstacles such as cliffs, lakes or other large bodies of water, deep and wide ravines, and mountains. Remoteness by itself is not a natural barrier.

“Nonfriable asbestos-containing material” means any material containing more than 1 percent asbestos as determined using the method specified in Appendix J to 29 CFR § 1910.1001, Polarized Light Microscopy of Asbestos, that, when dry, cannot be crumbled, pulverized, or reduced to powder by hand pressure.

“Nonscheduled renovation operation” means a renovation operation necessitated by the routine failure of equipment, which is expected to occur within a given period based on past operating experience, but for which an exact date cannot be predicted.

“Outside air” means the air outside buildings and structures, including, but not limited to, the air under a bridge or in an open air ferry dock.

“Owner or operator of a demolition or renovation activity” means any person who owns, leases, operates, controls, or supervises the facility being demolished or renovated or any person who owns, leases, operates, controls, or supervises the demolition or renovation operation, or both.

“Particulate asbestos material” means finely divided particles of asbestos or material containing asbestos.

“Planned renovation operations” means a renovation operation, or a number of such operations, in which some RACM will be removed or stripped within a given period of time and that can be predicted. Individual nonscheduled operations are included if a number of such operations can be predicted to occur during a given period of time based on operating experience.

“Regulated asbestos-containing material (RACM)” means: (a) Friable asbestos material, (b) Category I nonfriable ACM that has become friable, (c) Category I nonfriable ACM that will be or has been subjected to sanding, grinding, cutting, or abrading, or (d) Category II nonfriable ACM that has a high probability of becoming or has become crumbled, pulverized, or reduced to powder by the forces expected to act on the material in the course of demolition or renovation operations regulated by this subpart.

“Remove” means to take out RACM or facility components that contain or are covered with RACM from any facility.

“Renovation” means altering a facility or one or more facility components in any way, including the stripping or removal of RACM from a facility component.

Operations in which load-supporting structural members are wrecked or taken out are demolitions.

“Resilient floor covering” means asbestos-containing floor tile, including asphalt and vinyl floor tile, and sheet vinyl floor covering containing more than 1 percent asbestos as determined using polarized light microscopy according to the method specified in Appendix J to 29 CFR § 1910.1001, Polarized Light Microscopy of Asbestos.

“Strip” means to take off RACM from any part of a facility or facility components.

“Structural member” means any load supporting member of a facility, such as beams and load supporting walls; or any nonload-supporting member, such as ceilings and nonload-supporting walls.

“Visible emissions” means any emissions, which are visually detectable without the aid of instruments, coming from RACM or asbestos-containing waste material, or from any asbestos milling, manufacturing, or fabricating operation. This does not include condensed, uncombined water vapor.

“Waste generator” means any owner or operator of a source covered by this section whose act or process produces asbestos-containing waste material.

“Waste shipment record” means the shipping document, required to be originated and signed by the waste generator, used to track and substantiate the disposal of asbestos-containing waste material.

“Working day” means Monday through Friday and includes holidays that fall on any of the days Monday through Friday.

(c) Units and Abbreviations: Used in this section are abbreviations and symbols of units of measure. These are defined as follows:

(i) System International (SI) Units of Measure:

g = gram
kg = kilogram
m = meter
m² = square meter
m³ = cubic meter

(ii) Other Units of Measure:

C = Celsius (centigrade)
F = Fahrenheit
ft² = square feet
ft³ = cubic feet

yd² = square yards
min = minute
oz = ounces

(d) Address: All requests, reports, applications, submittals, and other communications to the Administrator pursuant to this section shall be submitted to the following address:

(i) Wyoming Department of Environmental Quality, Air Quality Division, 122 West 25th Street, Cheyenne, Wyoming 82002.

(e) [Reserved]

(f) Circumvention: No owner or operator shall build, erect, install, or use any article, machine, equipment, process, or method, the use of which conceals an emission which would otherwise constitute a violation of an applicable standard. Such concealment includes, but is not limited to, the use of gaseous dilutants to achieve compliance with a visible emissions standard, and the piecemeal carrying out of an operation to avoid coverage by a standard that applies only to operations larger than a specified size.

(g) Standard for Waste Disposal for Non-Facility Owners and Operators.

(i) All owners and operators conducting an asbestos abatement project, including an abatement project on a residential building, shall be responsible for complying with Federal requirements and State standards for packaging, transportation, and delivery to an approved waste disposal facility as provided in paragraph (m) of this section. A non-facility is any other facility not defined under the definition of “facility” including residential buildings having four or fewer dwelling units.

(h) Standard for Manufacturing.

(i) Applicability. This paragraph applies to the following manufacturing operations using commercial asbestos.

(A) The manufacture of cloth, cord, wicks, tubing, tape, twine, rope, thread, yarn, roving, lap, or other textile materials.

(B) The manufacture of cement products.

(C) The manufacture of fireproofing and insulating materials.

(D) The manufacture of friction products.

(E) The manufacture of paper, millboard, and felt.

(F) The manufacture of floor tile.

(G) The manufacture of paints, coatings, caulks, adhesives, and sealants.

(H) The manufacture of plastics and rubber materials.

(I) The manufacture of chlorine utilizing asbestos diaphragm technology.

(J) The manufacture of shotgun shell wads.

(K) The manufacture of asphalt concrete.

(ii) Standard. Each owner or operator of any of the manufacturing operations to which this paragraph applies shall either:

(A) Discharge no visible emissions to the outside air from these operations or from any building or structure in which they are conducted or from any fugitive sources; or

(B) Use the methods specified by paragraph (o) of this section to clean emissions containing asbestos material from these operations before they escape to, or are vented to, the outside air.

(C) Monitor each potential source of asbestos emissions from any part of the manufacturing facility, including air cleaning devices, process equipment, and buildings housing material processing and handling equipment, at least once each day during daylight hours for visible emissions to the outside air during periods of operation. The monitoring shall be by the visual observation of at least 15 seconds duration per source of emissions.

(D) Inspect each air cleaning device at least once each week for proper operation and for changes that signal potential for malfunctions, including, to the maximum extent possible without dismantling other than opening the device, the presence of tears, holes, and abrasions in filter bags and for dust deposits on the clean side of bags. For air cleaning devices that cannot be inspected on a weekly basis according to this paragraph, submit to the Administrator, and revise as necessary, a written maintenance plan to include, at a minimum, the following:

(I) Maintenance schedule.

(II) Recordkeeping plan.

(E) Maintain records of the results of visible emission monitoring and air cleaning device inspections using a format similar to that shown in Figures 1 and 2 and include the following:

(I) Date and time of each inspection.

(II) Presence or absence of visible emissions.

(III) Condition of fabric filters, including presence of any tears, holes and abrasions.

Figure 1. Record of Visible Emission Monitoring

(IV) Presence of dust deposits on clean side of fabric filters.

(V) Brief description of corrective actions taken, including date and time.

(VI) Daily hours of operation for each air cleaning device.

(F) Furnish upon request, and make available at the affected facility during normal business hours for inspection by the Administrator, all records required under this paragraph.

(G) Retain a copy of all monitoring and inspection records for at least 2 years.

(H) Submit quarterly a copy of the visible emission monitoring records to the Administrator if visible emissions occurred during the report period. Quarterly reports shall be postmarked by the 30th day following the end of the calendar quarter.

(i) Standard for Demolition and Renovation.

(i) Applicability. To determine which requirements of paragraphs (i)(i), (i)(ii), and (i)(iii) apply to the owner or operator of a demolition or renovation activity and prior to the commencement of the demolition or renovation, thoroughly inspect the affected facility or part of the facility where the demolition or renovation operation will occur for the presence of asbestos, including Category I and Category II nonfriable ACM. The requirements of paragraphs (i)(ii) and (i)(iii) apply to each owner or operator of a demolition or renovation activity, including the removal of RACM as follows:

(A) In a facility being demolished, all the requirements of paragraphs (i)(ii) and (i)(iii) apply, except as provided in paragraph (i)(i)(C), if the combined amount of RACM is:

(I) At least 80 linear meters (260 linear feet) on pipes or at least 15 square meters (160 square feet) on other facility components, or

(II) At least 1 cubic meter (35 cubic feet) off facility components where the length or area could not be measured previously.

(B) In a facility being demolished, only the notification requirements of paragraphs (i)(ii)(A), (B), (C)(I) and (IV), and (D)(I) through (D)(IX) and (XVI) apply, if the combined amount of RACM is:

(I) Less than 80 linear meters (260 linear feet) on pipes and less than 15 square meters (160 square feet) on other facility components, and

(II) Less than one cubic meter (35 cubic feet) off facility components where the length or area could not be measured previously or there is no asbestos.

(C) If the facility is being demolished under an order of a State or local government agency, issued because the facility is structurally unsound and in danger of imminent collapse, only the requirements of paragraphs (i)(ii)(A), (i)(ii)(B), (i)(ii)(C)(III), (i)(ii)(D) (except (i)(ii)(D)(VIII)), (i)(ii)(E), and (i)(iii)(D) through (i)(iii)(I) apply.

(D) In a facility being renovated, including any individual nonscheduled renovation operation, all the requirements of paragraphs (i)(ii) and (i)(iii) apply if the combined amount of RACM to be stripped, removed, dislodged, cut, drilled, or similarly disturbed is:

(I) At least 80 linear meters (260 linear feet) on pipe or at least 15 square meters (160 square feet) on other facility components, or

(II) At least 1 cubic meter (35 cubic feet) off facility components where the length or area could not be measured previously.

(III) To determine whether paragraph (i)(i)(D) applies to planned renovation operations involving individual nonscheduled operations, predict the combined additive amount of RACM to be removed or stripped during a calendar year or January 1 through December 31.

(IV) To determine whether paragraph (i)(i)(D) applies to emergency renovation operations, estimate the combined amount of RACM to be removed or stripped as a result of the sudden, unexpected event that necessitated the renovation.

(E) In a facility being renovated, only the notification requirements of paragraphs (i)(ii)(A), (B), (C)(I) and (IV), and (D)(I) through (IX) and (XVI) apply, if the combined amount of RACM is:

(I) Less than 80 linear meters (260 linear feet) on pipes or less than 15 square meters (160 square feet) on other facility components, and

(II) Less than 1 cubic meter (35 cubic feet) off facility components where the length or area could not be measured previously or there is no asbestos.

(ii) Notification Requirements. Each owner or operator of a demolition or renovation activity to which this section applies shall:

(A) Provide the Administrator with written notice of intention to demolish or renovate. Delivery of the notice by U.S. Postal Service, commercial delivery service, or hand delivery is acceptable.

(B) Update notice, as necessary, including when the amount of asbestos affected changes by at least 20 percent.

(C) Postmark or deliver the notice as follows:

(I) At least 10 working days before asbestos stripping or removal work or any other activity begins (such as site preparation that would break up, dislodge or similarly disturb asbestos material), if the operation is described in paragraphs (i)(i)(A) and (D) (except (i)(i)(D)(III) and (i)(i)(D)(IV)). If the operation is as described in paragraph (i)(i)(B), notification is required 10 working days before demolition begins.

(II) At least 10 working days before the end of the calendar year preceding the year for which notice is being given for renovations described in paragraph (i)(i)(D)(III).

(III) As early as possible before, but not later than, the following working day if the operation is a demolition ordered according to paragraph (i)(i)(C) or, if the operation is a renovation described in paragraph (i)(i)(D)(IV).

(IV) For asbestos stripping or removal work in a demolition or renovation operation, described in paragraphs (i)(i)(A) and (D) (except (i)(i)(D)(III) and (i)(i)(D)(IV)), and for a demolition described in paragraph (i)(i)(B), that will begin on a date other than the one contained in the original notice, notice of the new start date must be provided to the Administrator as follows:

(1.) When the asbestos stripping or removal operation or demolition operation covered by this paragraph will begin after the date contained in the notice,

a. Notify the Administrator of the new start date by telephone as soon as possible before the original start date, and

b. Provide the Administrator with a written notice of the new start date as soon as possible before, and no later than, the original start date. Delivery of the updated notice by the U.S. Postal Service, commercial delivery service, or hand delivery is acceptable.

(2.) When the asbestos stripping or removal operation or demolition operation covered by this paragraph will begin on a date earlier than the original start date,

a. Provide the Administrator with a written notice of the new start date at least 10 working days before asbestos stripping or removal work begins.

b. For demolitions covered by paragraph (i)(i)(B), provide the Administrator written notice of a new start date at least 10 working days before commencement of demolition. Delivery of updated notice by U.S. Postal Service, commercial delivery service, or hand delivery is acceptable.

(3.) In no event shall an operation covered by this paragraph begin on a date other than the date contained in the written notice of the new start date.

(D) Include the following in the notice:

(I) An indication of whether the notice is the original or a revised notification.

(II) Name, address, and telephone number of both the facility owner and operator and the asbestos removal contractor owner or operator.

(III) Type of operation: demolition or renovation.

(IV) Description of the facility or affected part of the facility including the size (square meters [square feet] and number of floors), age, and present and prior use of the facility.

(V) Procedure, including analytical methods, employed to detect the presence of RACM and Category I and Category II nonfriable ACM.

(VI) Estimate of the approximate amount of RACM to be removed from the facility in terms of length of pipe in linear meters (linear feet), surface area in square meters (square feet) on other facility components, or volume in cubic meters (cubic feet) if off the facility components. Also estimate the approximate amount of Category I and Category II nonfriable ACM in the affected part of the facility that will not be removed before demolition.

(VII) Location and street address (including building number or name and floor or room number, if appropriate), city, county, and state, or the facility being demolished or renovated.

(VIII) Scheduled starting and completion dates of asbestos removal work (or any other activity, such as site preparation that would break up, dislodge, or similarly disturb asbestos material) in a demolition or renovation; planned renovation operations involving individual nonscheduled operations shall only include the beginning and ending dates of the report period as described in paragraph (i)(i)(D)(III).

(IX) Scheduled starting and completion dates of demolition or renovation.

(X) Description of planned demolition or renovation work to be performed and method(s) to be employed, including demolition or renovation techniques to be used and description of affected facility components.

(XI) Description of work practices and engineering controls to be used to comply with the requirements of this section, including asbestos removal and waste-handling emission control procedures.

(XII) Name and location of the waste disposal site where the asbestos-containing waste material will be deposited.

(XIII) A certification that the individuals supervising and performing the stripping and removal described by this notification have received the training required by paragraph (i)(iii)(H).

(XIV) For facilities described in paragraph (i)(i)(C), the name, title, and authority of the State or local government representative who has ordered the demolition, the date that the order was issued, and the date on which the demolition was ordered to begin. A copy of the order shall be attached to the notification.

(XV) For emergency renovations described in paragraph (b)(xii) of this section, the date and hour that the emergency occurred, a description of the sudden, unexpected event, and an explanation of how the event caused an unsafe condition, or would cause equipment damage or an unreasonable financial burden.

(XVI) Description of procedures to be followed in the event that unexpected RACM is found or Category II nonfriable ACM becomes crumbled, pulverized, or reduced to powder.

(XVII) Name, address, and telephone number of the waste transporter.

(E) The information required in paragraph (i)(ii)(D) must be reported using a form similar to that shown in Figure 3.

(iii) Procedures for Asbestos Emission Control. Each owner or operator of a demolition or renovation activity to whom this paragraph applies, according to paragraph (i)(i), shall comply with the following procedures:

(A) Remove all RACM from a facility being demolished or renovated before any activity begins that would break up, dislodge, or similarly disturb the material or preclude access to the material for subsequent removal. RACM need not be removed before demolition if:

(I) It is Category I nonfriable ACM that is not in poor condition and is not friable.

(II) It is on a facility component that is encased in concrete or other similarly hard material and is adequately wet whenever exposed during demolition; or

(III) It was not accessible for testing and was, therefore, not discovered until after demolition began and, as a result of the demolition, the material cannot be safely removed. If not removed for safety reasons, the exposed RACM and any asbestos-contaminated debris must be treated as asbestos-containing waste material and adequately wet at all times until disposed of.

(IV) They are Category II nonfriable ACM and the probability is low that the materials will become crumbled, pulverized, or reduced to powder during demolition.

(B) When a facility component that contains, is covered with, or is coated with RACM is being taken out of the facility as a unit or in sections:

(I) Adequately wet all RACM exposed during cutting or disjuncting operations; and

(II) Carefully lower each unit or section to the floor and to ground level, not dropping, throwing, sliding, or otherwise damaging or disturbing the RACM.

(C) When RACM is stripped from a facility component while it remains in place in the facility, adequately wet the RACM during the stripping operation.

(I) In renovation operations, wetting is not required if:

(1.) The owner or operator has obtained prior written approval from the Administrator based on a written application that wetting to comply with this paragraph would unavoidably damage equipment or present a safety hazard; and

(2.) The owner or operator uses one of the following emission control methods:

a. A local exhaust ventilation and collection system designed and operated to capture the particulate asbestos material produced by the stripping and removal of the asbestos materials. The system must exhibit no visible emissions to the outside air or be designed and operated in accordance with the requirements in paragraph (o).

b. A glove-bag system designed and operated to contain the particulate asbestos material produced by the stripping of the asbestos materials.

c. Leak-tight wrapping to contain all RACM prior to dismantlement.

(II) In renovation operations where wetting would result in equipment damage or a safety hazard, and the methods allowed in paragraph (i)(iii)(C)(I) cannot be used, another method may be used after obtaining written approval from the Administrator based upon a determination that it is equivalent to wetting in controlling emissions or to the methods allowed in paragraph (i)(iii)(C)(I).

(III) A copy of the Administrator's written approval shall be kept at the worksite and made available for inspection.

(D) After a facility component covered with, coated with, or containing RACM has been taken out of the facility as a unit or in sections pursuant to paragraph (i)(iii)(B), it shall be stripped or contained in leak-tight wrapping, except as described in paragraph (i)(iii)(E). If stripped, either:

(I) Adequately wet the RACM during stripping; or

(II) Use a local exhaust ventilation and collection system designed and operated to capture the particulate asbestos material produced by the stripping. The system must exhibit no visible emissions to the outside air or be designed and operated in accordance with the requirements in paragraph (o).

(E) For large facility components such as reactor vessels, large tanks, and steam generators, but not beams (which must be handled in accordance with paragraphs (i)(iii)(B), (C), and (D)), the RACM is not required to be stripped if the following requirements are met:

(I) The component is removed, transported, stored, disposed of, or reused without disturbing or damaging the RACM.

(II) The component is encased in a leak-tight wrapping.

(III) The leak-tight wrapping is labeled according to paragraphs (m)(iv) during all loading and unloading operations and during storage.

(F) For all RACM, including material that has been removed or stripped:

(I) Adequately wet the material and ensure that it remains wet until collected and contained or treated in preparation for disposal in accordance with paragraph (m).

(II) Carefully lower the material to the ground and floor, not dropping, throwing, sliding, or otherwise damaging or disturbing the material.

(III) Transport the material to the ground via leak-tight chutes or containers if it has been removed or stripped more than 50 feet above ground level and was not removed as units or in sections.

(IV) RACM contained in leak-tight wrapping that has been removed in accordance with paragraphs (i)(iii)(D) and (i)(iii)(C)(I)(2).c. need not be wetted.

(G) When the temperature at the point of wetting is below 0°C (32°F):

(I) The owner or operator need not comply with paragraph (i)(iii)(B)(I) and the wetting provisions of paragraph (i)(iii)(C).

(II) The owner or operator shall remove facility components containing, coated with, or covered with RACM as units or in sections to the maximum extent possible.

(III) During periods when wetting operations are suspended due to freezing temperatures, the owner or operator must record the temperature in the area containing the facility components at the beginning, middle, and end of each workday and keep daily temperature records available for inspection by the Administrator during normal business hours at the demolition or renovation site. The owner or operator shall retain the temperature records for at least 2 years.

(H) No RACM shall be stripped, removed, or otherwise handled or disturbed at a facility regulated by this section unless the individuals supervising and performing the operation have been trained in the provisions of this regulation and the means of complying with them. Asbestos School Hazard Abatement Reauthorization Act (ASHARA) training will be acceptable to meet this requirement. Every year, the

individuals supervising and performing asbestos operations shall receive refresher training in the provisions of this regulation. The required training shall include as a minimum: applicability; notifications; material identification; control procedures for removals including, at least, wetting, local exhaust ventilation, negative pressure enclosures, glove-bag procedures, and High Efficiency Particulate Air (HEPA) filters; waste disposal work practices; reporting and recordkeeping; and asbestos hazards and worker protection. Evidence that the required training has been completed shall be posted and made available for inspection by the Administrator at the demolition or renovation site.

(I) For facilities described in paragraph (i)(i)(C), adequately wet the portion of the facility that contains RACM during the wrecking operation.

(J) If a facility is demolished by intentional burning, all RACM including Category I and Category II nonfriable ACM must be removed in accordance with the NESHAP before burning.

(j) Standard for Spraying.

The owner or operator of an operation in which asbestos-containing materials are spray applied shall comply with the following requirements:

(i) For spray-on application on buildings, structures, pipes, and conduits do not use material containing more than 1 percent asbestos as determined using the method specified in Appendix J to 29 CFR § 1910.1001, Polarized Light Microscopy of Asbestos, except as provided in paragraph (j)(iii).

(ii) For spray-on application of materials that contain more than 1 percent asbestos as determined using the method specified in Appendix J to 29 CFR § 1910.1001, Polarized Light Microscopy of Asbestos, on equipment and machinery, except as provided in paragraph (j)(iii):

(A) Notify the Administrator at least 20 days before beginning the spraying operation. Include the following information in the notice:

(I) Name and address of owner or operator.

(II) Location of spraying operation.

(III) Procedures to be followed to meet the requirements of paragraph (j).

(B) Discharge no visible emissions to the outside air from spray-on application of the asbestos-containing material or use the methods specified by

paragraph (o) to clean emissions containing particulate asbestos material before they escape to, or are vented to, the outside air.

(iii) The requirements of paragraphs (j)(i) and (j)(ii) do not apply to the spray-on application of materials where the asbestos fibers in the materials are encapsulated with a bituminous or resinous binder during spraying and the materials are not friable after drying.

(k) Standard for Fabricating.

(i) Applicability. This section applies to the following fabrication operations using commercial asbestos:

(A) The fabrication of cement building products.

(B) The fabrication of friction products, except those operations that primarily install asbestos friction materials on motor vehicles.

(C) The fabrication of cement on silicate board for ventilation hoods; ovens; electrical panels; laboratory furniture, bulkheads, partitions, and ceilings for marine construction; and flow control devices for the molten metal industry.

(ii) Standard. Each owner or operator of any of the fabricating operations to which this section applies shall either:

(A) Discharge no visible emissions to the outside air from any of the operations or from any building or structure in which they are conducted or from any other fugitive sources; or

(B) Use the methods specified by paragraph (o) to clean emissions containing particulate asbestos material before they escape to, or are vented to, the outside air.

(C) Monitor each potential source of asbestos emissions from any part of the fabricating facility, including air cleaning devices, process equipment, and buildings that house equipment for material processing and handling, at least once a day, during daylight hours, for visible emissions to the outside air during periods of operation. The monitoring shall be by visual observation of at least 15 seconds duration per source of emission.

(D) Inspect each air cleaning device at least once each week for proper operation and for changes that signal the potential for malfunctions, including, to the maximum extent possible without dismantling other than opening the device, the presence of tears, holes, and abrasions in the filter bags and for dust deposits on the clean side of bags. For air cleaning devices that cannot be inspected on a weekly basis

according to this paragraph, submit to the Administrator, and revise as necessary, a written maintenance plan to include, at a minimum, the following:

(I) Maintenance schedule.

(II) Recordkeeping plan.

(E) Maintain records of the results of visible emission monitoring and air cleaning device inspections using a format similar to that shown in Figures 1 and 2 and include the following:

(I) Date and time of each inspection.

(II) Presence or absence of visible emissions.

(III) Condition of fabric filters, including presence of any tears, holes, and abrasions.

(IV) Presence of dust deposits on clean side of fabric filters.

(V) Brief description of corrective actions taken, including date and time.

(VI) Daily hours of operation for each air cleaning device.

(F) Furnish upon request and make available at the affected facility during normal business hours for inspection by the Administrator, all records required under this paragraph.

(G) Retain a copy of all monitoring and inspection records for at least 2 years.

(H) Submit quarterly a copy of the visible emission monitoring records to the Administrator if visible emissions occurred during the report period. Quarterly reports shall be postmarked by the 30th day following the end of the calendar quarter.

(I) Standard for Insulating Materials. No owner or operator of a facility may install or reinstall on a facility component any insulating materials that contain commercial asbestos if the materials are either molded and friable or wet-applied and friable after drying. The provisions of this paragraph do not apply to spray-applied insulating materials regulated under paragraph (j).

(m) Standard for Waste Disposal for Non-facilities, Manufacturing, Demolition, Renovation, Spraying, and Fabricating. Each owner or operator of any source covered under the provisions of paragraphs (g), (h), (i), (j), or (k) shall meet the requirements of the Solid Waste Division of the Wyoming Department of Environmental Quality or, at a minimum, the requirements of the following:

(i) Discharge no visible emissions to the outside air during the collection, processing (including incineration), packaging, or transporting of any asbestos-containing waste material generated by the source, or use one of the emission control and waste treatment methods specified in paragraphs (m)(i)(A) through (D).

(A) Adequately wet asbestos-containing waste material as follows:

(I) Mix control device asbestos waste to form a slurry; adequately wet other asbestos-containing waste material; and

(II) Discharge no visible emissions to the outside air from collection, mixing, wetting, and handling operations, or use the methods specified by paragraph (o) to clean emissions containing particulate asbestos material before they escape to, or are vented to, the outside air; and

(III) After wetting, seal all asbestos-containing waste material in leak-tight containers while wet; or, for materials that will not fit into containers without additional breaking, put materials into leak-tight wrapping; and

(IV) Label the containers or wrapped materials specified in paragraph (m)(i)(A)(III) using warning labels specified by Occupational Safety and Health Standards of the Department of Labor, Occupational Safety and Health Administration (OSHA) under 29 CFR § 1910.1001(j)(4) or § 1926.1101(k)(8). The labels shall be printed in letters of sufficient size and contrast so as to be readily visible and legible.

(V) For asbestos-containing waste material to be transported off the facility site, label containers or wrapped materials with the name of the waste generator and the location at which the waste was generated.

(B) Process asbestos-containing waste material into nonfriable forms as follows:

(I) Form all asbestos-containing waste material into nonfriable pellets or other shapes;

(II) Discharge no visible emissions to the outside air from collection and processing operations, including incineration, or use the method specified

by paragraph (o) to clean emissions containing particulate asbestos materials before they escape to, or are vented to, the outside air.

(C) For facilities demolished where the RACM is not removed prior to demolition, adequately wet asbestos-containing waste material at all times after demolition and keep wet during handling and loading for transport to a disposal site. Asbestos-containing waste materials covered by this paragraph do not have to be sealed in leak-tight containers or wrapping but may be transported and disposed of in bulk.

(D) Use an alternative emission control and waste treatment method that has received prior written approval by the EPA Administrator.

(E) As applied to demolition and renovation, the requirements of paragraph (m)(i) do not apply to Category I and Category II nonfriable ACM waste that did not become crumbled, pulverized, or reduced to powder.

(ii) All asbestos-containing waste material shall be deposited as soon as is practical by the waste generator at:

(A) A waste disposal site operated in accordance with the provisions of paragraph (q), or

(B) An EPA-approved site that converts RACM and asbestos-containing waste material into nonasbestos (asbestos-free) material according to the provisions of paragraph (r).

(C) The requirements of paragraph (m)(ii) do not apply to Category I nonfriable ACM that is not RACM.

(iii) Mark vehicles used to transport asbestos-containing waste material during the loading and unloading of waste so that the signs are visible. The markings must:

(A) Be displayed in such a manner and location that a person can easily read the legend.

(B) Conform to the requirements for 51 cm X 36 cm (20 in X 14 in) upright format signs specified in 29 CFR § 1910.145(d)(2) and this paragraph; and

(C) Display the following legend in the lower panel with letter sizes and styles of a visibility at least equal to those specified below.

Legend
DANGER
ASBESTOS DUST HAZARD
CANCER AND LUNG DISEASE HAZARD
Authorized Personnel Only

Notation
2.5 cm (1 inch) Sans Serif, Gothic or Block
2.5 cm (1 inch) Sans Serif, Gothic or Block
1.9 cm (3/4 inch) Sans Serif, Gothic or Block
14 Point Gothic

Spacing between any two lines must be at least equal to the height of the upper of the two lines.

(iv) For All Asbestos-Containing Waste Material Transported Off the Facility Site:

(A) Maintain waste shipment records, using a form similar to that shown in Figure 4, and include the following information:

(I) The name and telephone number of the disposal site operator.

(II) The name and physical site location of the disposal site.

(III) The date transported.

(IV) The name, address, and telephone number of the transporter(s).

GENERATOR		
1. Work site name and mailing address	Owner's name	Owner's telephone no.
2. Operator's name and address		Operator's telephone no.
3. Waste disposal site (WDS) name, mailing address, and physical site location		WDS telephone no.
4. Name and address of responsible agency		
5. Description of materials	6. Containers No. Type	7. Total quantity m ³ (yd ³)
8. Special handling instructions and additional information		
9. OPERATOR'S CERTIFICATION: I hereby declare that the contents of this consignment are fully and accurately described above by proper shipping name and are classified, packed, marked, and labeled, and are in all respects in proper condition for transport by highway according to applicable international and government regulations.		
Printed/typed name & title	Signature	Month Day Year
Transporter		
10. Transporter 1 (Acknowledgment of receipt of materials)		
Printed/typed name & title	Signature	Month Day Year
Address and telephone no.		
11. Transporter 2 (Acknowledgment of receipt of materials)		
Printed/typed name & title	Signature	Month Day Year
Address and telephone no.		
Disposal Site		
12. Discrepancy indication space		
13. Waste disposal site owner or operator: Certification of receipt of asbestos materials covered by this manifest except as noted in item 12.		
Printed/typed name & title	Signature	Month Day Year

Figure 4. Waste Shipment Record

(V) A certification that the contents of this consignment are fully and accurately described by proper shipping name and are classified, packed, marked, and labeled, and are in all respects in proper condition for transport by highway according to applicable international and governmental regulations.

(B) Provide a copy of the waste shipment record, described in paragraph (m)(iv)(A), to the disposal site owners or operators at the same time as the asbestos-containing waste material is delivered to the disposal site.

(C) For waste shipments where a copy of the waste shipment record, signed by the owner or operator of the designated disposal site, is not received by the waste generator within 35 days of the date the waste was accepted by the initial transporter, contact the transporter and/or the owner or operator of the designated disposal site to determine the status of the waste shipment.

(D) Report in writing to the Wyoming Department of Environmental Quality, Air Quality Division, if a copy of the waste shipment record, signed by the owner or operator of the designated waste disposal site, is not received by the waste generator within 45 days of the date the waste was accepted by the initial transporter. Include in the report the following information:

(I) A copy of the waste shipment record for which a confirmation of delivery was not received, and

(II) A cover letter signed by the waste generator explaining the efforts taken to locate the asbestos waste shipment and the results of those efforts.

(E) Retain a copy of all waste shipment records, including a copy of the waste shipment record signed by the owner or operator of the designated waste disposal site, for at least 2 years.

(v) Furnish upon request, and make available for inspection by the Administrator, all records required under this section.

(n) Standard for Inactive Waste Disposal Sites for Manufacturing and Fabricating Operations. Each owner or operator of any inactive waste disposal site that was operated by sources covered under paragraphs (h) or (k) and received deposits of asbestos-containing waste material generated by the sources, shall meet the requirements of the Solid Waste Division of the Wyoming Department of Environmental Quality or at a minimum:

(i) Comply With One of the Following:

(A) Either discharge no visible emissions to the outside air from an inactive waste disposal site subject to the paragraph; or

(B) Cover the asbestos-containing waste material with at least 15 centimeters (6 inches) of compacted nonasbestos-containing material, and grow and maintain a cover of vegetation on the area adequate to prevent exposure of the asbestos-containing waste material. In desert areas where vegetation would be difficult to maintain, at least 8 additional centimeters (3 inches) of well-graded, nonasbestos crushed rock may be placed on top of the final cover instead of vegetation and maintained to prevent emissions; or

(C) Cover the asbestos-containing waste material with at least 60 centimeters (2 feet) of compacted nonasbestos-containing material, and maintain it to prevent exposure of the asbestos-containing waste; or

(D) For inactive waste disposal sites for asbestos tailings, a resinous or petroleum-based dust suppression agent that effectively binds dust to control surface air emissions may be used instead of the methods in paragraphs (n)(i)(A), (B), and (C). Use the agent in the manner and frequency recommended for the particular asbestos tailings by the manufacturer of the dust suppression agent to achieve and maintain dust control. Obtain prior written approval of the Administrator to use other equally effective dust suppression agents. For purposes of this paragraph, any used, spent, or other waste oil is not considered a dust suppression agent.

(ii) Unless a natural barrier adequately deters access by the general public, install and maintain warning signs and fencing as follows, or comply with paragraph (n)(i)(B) or (n)(i)(C).

(A) Display warning signs at all entrances and at intervals of 100 m (328 feet) or less along the property line of the site or along the perimeter of the sections of the site where asbestos-containing waste material was deposited. The warning signs must:

(I) Be posted in such a manner and location that a person can easily read the legend;

(II) Conform to the requirements of 51 cm x 36 cm (20" x 14") upright format signs specified in 29 CFR § 1910.145(d)(4) and this paragraph; and

(III) Display the following legend in the lower panel with letter sizes and styles of a visibility at least equal to those specified in this paragraph.

Legend
ASBESTOS WASTE DISPOSAL SITE
DO NOT CREATE DUST
Breathing Asbestos is Hazardous to Your Health

Notation
2.5 cm (1 inch) Sans Serif, Gothic or Block
1.9 cm (3/4 inch) Sans Serif, Gothic or Block
14 point Gothic

Spacing between any two lines must be at least equal to the height of the upper of the two lines.

(B) Fence the perimeter of the site in a manner adequate to deter access by the general public.

(C) When requesting a determination on whether a natural barrier adequately deters public access, supply information enabling the Administrator to determine whether a fence or a natural barrier adequately deters access by the general public.

(iii) The owner or operator may use an alternative control method that has received prior approval of the EPA Administrator rather than comply with the requirements of paragraph (n)(i) or (n)(ii).

(iv) Notify the Administrator in writing at least 45 days prior to excavating or otherwise disturbing any asbestos-containing waste material that has been deposited at a waste disposal site under this section, and follow the procedures specified in the notification. If the excavation will begin on a date other than the one contained in the original notice, notice of the new start date must be provided to the Administrator at least 10 working days before excavation begins and in no event shall excavation begin earlier than the date specified in the original notification. Include the following information in the notice:

(A) Scheduled starting and completion dates.

(B) Reason for disturbing the waste.

(C) Procedures to be used to control emissions during the excavation, storage, transport, and ultimate disposal of the excavated asbestos-containing waste material. If deemed necessary, the Administrator may require changes in the emission control procedures to be used.

(D) Location of any temporary storage site and the final disposal site.

(v) Within 60 days of a site becoming inactive and after the effective date of this subpart, record, in accordance with State law, a notation on the deed to the facility property and on any other instrument that would normally be examined during a title search; this notation will in perpetuity notify any potential purchaser of the property that:

(A) The land has been used for the disposal of asbestos-containing waste material;

(B) The survey plot and record of the location and quantity of asbestos-containing waste disposed of within the disposal site required in paragraph (q)(vi) have been filed with the Administrator; and

(C) The site is subject to Chapter 3, Section 8 of the Wyoming Air Quality Standards and Regulations and to 40 CFR part 61, Subpart M.

(o) Air Cleaning.

(i) The owner or operator who uses air cleaning, as specified in paragraphs (h)(ii)(B), (i)(iii)(C)(I)(2.)a., (i)(iii)(D)(II), (j)(ii)(B), (k)(ii)(B), (m)(i)(A)(II), (m)(i)(B)(II) and (r)(v) shall:

(A) Use fabric filter collection devices, except as noted in paragraph (o)(ii), doing all of the following:

(I) Ensuring that the airflow permeability, as determined by ASTM Method D737-04 Test Method for Air Permeability of Textile Fabrics, does not exceed $9 \text{ m}^3/\text{min}/\text{m}^2$ ($30 \text{ ft}^3/\text{min}/\text{ft}^2$) for woven fabrics or $11 \text{ m}^3/\text{min}/\text{m}^2$ ($35 \text{ ft}^3/\text{min}/\text{ft}^2$) for felted fabrics, except that $12 \text{ m}^3/\text{min}/\text{m}^2$ ($40 \text{ ft}^3/\text{min}/\text{ft}^2$) for woven and $14 \text{ m}^3/\text{min}/\text{m}^2$ ($45 \text{ ft}^3/\text{min}/\text{ft}^2$) for felted fabrics is allowed for filtering air from asbestos ore dryers;

(II) Ensuring that felted fabric weighs at least 475 grams per square meter (14 ounces per square yard) and is at least 1.6 millimeters (one-sixteenth inch) thick throughout; and

(III) Avoiding the use of synthetic fabrics that contain fill yarn other than that which is spun.

(B) Properly install, use, operate, and maintain all air-cleaning equipment authorized by this paragraph. Bypass devices may be used only during upset or emergency conditions and then only for so long as it takes to shut down the operation generating the particulate asbestos material.

(C) For fabric filter collection devices installed after January 10, 1989, provide for easy inspection for faulty bags.

(ii) There are the following exceptions to paragraph (o)(i)(A):

(A) After January 10, 1989, if the use of fabric creates a fire or explosion hazard, or the Administrator determines that a fabric filter is not feasible, the Administrator may authorize as a substitute the use of wet collectors designed to operate with a unit contacting energy of at least 9.95 kilopascals (40 inches water gage pressure).

(B) Use a HEPA filter that is certified to be at least 99.97 percent efficient for 0.3 micron particles.

(C) The EPA Administrator may authorize the use of filtering equipment other than described in paragraphs (o)(i)(A) and (o)(ii)(A) and (B) if the owner or operator demonstrates to the EPA Administrator's satisfaction that it is equivalent to the described equipment in filtering particulate asbestos material.

(p) Reporting.

(i) Any new source to which this section applies (with the exception of sources subject to paragraphs (i), (j), and (l)), which has an initial startup date preceding the effective date of this revision, shall provide the following information to the Administrator postmarked or delivered within 90 days of the effective date. In the case of a new source that does not have an initial startup date preceding the effective date, the information shall be provided, postmarked or delivered, within 90 days of the initial startup date. Any owner or operator of an existing source shall provide the following information to the Administrator within 90 days of the effective date of this subpart unless the owner or operator of the existing source has previously provided this information to the Administrator. Any changes in the information provided by any existing source shall be provided to the Administrator, postmarked or delivered, within 30 days after the change.

(A) A description of the emission control equipment used for each process; and

(I) If the fabric device uses a woven fabric, the airflow permeability in $\text{m}^3/\text{min}/\text{m}^2$ and; if the fabric is synthetic, whether the fill yarn is spun or not spun; and

(II) If the fabric filter device uses a felted fabric, the density in g/m^2 , the minimum thickness in inches and the airflow permeability in $\text{m}^3/\text{min}/\text{m}^2$.

(B) If a fabric filter device is used to control emissions,

(I) The airflow permeability in $\text{m}^3/\text{min}/\text{m}^2$ ($\text{ft}^3/\text{min}/\text{ft}^2$) if the fabric filter device uses a woven fabric, and, if the fabric is synthetic, whether the fill yarn is spun or not spun; and

(II) If the fabric filter device uses a felted fabric, the density in g/m^2 (oz/yd^2), the minimum thickness in millimeters (inches), and the airflow permeability in $\text{m}^3/\text{min}/\text{m}^2$ ($\text{ft}^3/\text{min}/\text{ft}^2$).

(C) If a HEPA filter is used to control emissions, the certified efficiency.

(D) For sources subject to paragraph (m):

(I) A brief description of each process that generates asbestos-containing waste material;

(II) The average volume of asbestos-containing waste material disposed of measured in m^3/day (yd^3/day);

(III) The emission control methods used in all stages of waste disposal; and

(IV) The type of disposal site or incineration site used for ultimate disposal, the name of the site operator, and the name and location of the disposal site.

(E) For sources subject to paragraphs (n) and (q):

(I) A brief description of the site; and

(II) The method or methods used to comply with the standard, or alternate procedures to be used.

(ii) The information required by paragraph (p)(i) must accompany the information required by 40 CFR part 61, Subpart A, § 61.10. Active waste disposal sites subject to paragraph (q) shall also comply with this provision. Demolition and renovation, spraying, and insulating materials are exempted from the requirements of 40 CFR § 61.10(a). The information described in this paragraph must be reported using the format of Appendix A of CFR 40 part 61 as a guide.

(q) Standard for Active Waste Disposal Sites. Each owner or operator of an active waste disposal site that receives asbestos-containing waste material from a source covered under paragraphs (m) or (r) shall meet the requirements of the Solid Waste Division of the Wyoming Department of Environmental Quality, or at a minimum the following:

(i) Either there must be no visible emissions to the outside air from any active waste disposal site where asbestos-containing waste material has been deposited, or the requirements of paragraph (q)(iii) or (q)(iv) must be met.

(ii) Unless a natural barrier adequately deters access by the general public, either warning signs and fencing must be installed and maintained as follows, or the requirements of paragraph (q)(iii)(A) must be met.

(A) Warning signs must be displayed at all entrances and at intervals of 100 m (330 ft) or less along the property line of the site or along the perimeter of the sections of the site where asbestos-containing waste material is deposited. The warning signs must:

(I) Be posted in such a manner and location that a person can easily read the legend;

(II) Conform to the requirements of 51 cm x 36 cm (20" x 14") upright format signs specified in 29 CFR § 1910.145(d)(4) and this paragraph; and

(III) Display the following legend in the lower panel with letter sizes and styles of a visibility at least equal to those specified below.

Legend
ASBESTOS WASTE DISPOSAL SITE
DO NOT CREATE DUST
Breathing Asbestos is Hazardous to Your Health

Notation
2.5 cm (1 inch) Sans Serif, Gothic or Block
1.9 cm (3/4 inch) Sans Serif, Gothic or Block
14 point Gothic

Spacing between any two lines must be at least equal to the height of the upper of the two lines.

(B) The perimeter of the disposal site must be fenced in a manner adequate to deter access by the general public.

(C) Upon request and supply of appropriate information, the Administrator will determine whether a fence or a natural barrier adequately deters access by the general public.

(iii) Rather than meet the no visible emission requirement of paragraph (q)(i), at the end of each operating day, or at least once every 24-hour period while the

site is in continuous operation, the asbestos-containing waste material that has been deposited at the site during the operating day or previous 24-hour period shall:

(A) Be covered with at least 15 centimeters (6 inches) of compacted nonasbestos-containing material, or

(B) Be covered with a resinous or petroleum-based dust suppression agent that effectively binds dust and controls wind erosion. Such an agent shall be used in the manner and frequency recommended for the particular dust by the dust suppression agent manufacturer to achieve and maintain dust control. Other equally effective dust suppression agents may be used upon prior approval by the Administrator. For purposes of this paragraph, any used, spent, or other waste oil is not considered a dust suppression agent.

(iv) Rather than meet the no visible emission requirement of paragraph (q)(i), use an alternative emissions control method that has received prior written approval by the EPA Administrator.

(v) For all asbestos-containing waste material received, the owner or operator of the active waste disposal site shall:

(A) Maintain waste shipment records, using a form similar to that shown in Figure 4, and include the following information:

(I) The name, address, and telephone number of the waste generator.

(II) The name, address, and telephone number of the transporter(s).

(III) The quantity of the asbestos-containing waste material in cubic meters (cubic yards).

(IV) The presence of improperly enclosed or uncovered waste, or any asbestos-containing waste material not sealed in leak-tight containers.

(V) The date of the receipt.

(B) Upon discovering the presence of a significant amount of improperly enclosed or uncovered waste, report in writing by the following working day to the local, State, or EPA Regional office responsible for administering the asbestos NESHAP program for the waste generator (identified in the waste shipment record), and, if that office is outside the State of Wyoming, also report in writing by the following working day to the Wyoming Department of Environmental Quality, Air Quality Division. Submit a copy of the waste shipment record along with the report.

(C) As soon as possible and no longer than 30 days after receipt of the waste, send a copy of the signed waste shipment record to the waste generator.

(D) Upon discovering a discrepancy between the quantity of waste designated on the waste shipment records and the quantity actually received, attempt to reconcile the discrepancy with the waste generator. If the discrepancy is not resolved within 15 days after receiving the waste, immediately report in writing to the local, State, or EPA Regional office responsible for administering the asbestos NESHAP program for the waste generator (identified in the waste shipment record), and, if that office is outside the State of Wyoming, also report in writing to the Wyoming Department of Environmental Quality, Air Quality Division. Describe the discrepancy and attempts to reconcile it, and submit a copy of the waste shipment record along with the report.

(E) Retain a copy of all records and reports required by this paragraph for at least 2 years.

(vi) Maintain, until closure, records of the location, depth and area, and quantity in cubic meters (cubic yards) of asbestos-containing waste material within the disposal site on a map or diagram of the disposal area.

(vii) Upon closure, comply with all the provisions of paragraph (n).

(viii) Submit to the Administrator, upon closure of the facility, a copy of records of asbestos waste disposal locations and quantities.

(ix) Furnish upon request, and make available during normal business hours for inspection by the Administrator, all records required under this paragraph.

(x) Notify the Administrator in writing at least 45 days prior to excavating or otherwise disturbing any asbestos-containing waste material that has been deposited at a waste disposal site and is covered. If the excavation will begin on a date other than the one contained in the original notice, notice of the new start date must be provided at least 10 working days before excavation begins and in no event shall excavation begin earlier than the date specified in the original notification. Include the following information in the notice.

(A) Scheduled starting and completion dates.

(B) Reason for disturbing the waste.

(C) Procedures to be used to control emissions during the excavation, storage, transport, and ultimate disposal of the excavated asbestos-containing waste material. If deemed necessary, the Administrator may require changes in the emission control procedures to be used.

(D) Location of any temporary storage site and the final disposal site.

(r) Standard for Operations That Convert Asbestos-Containing Waste Material Into Nonasbestos (Asbestos-Free) Material. Each owner or operator of an operation that converts RACM and asbestos-containing waste material into nonasbestos (asbestos-free) material shall:

(i) Obtain the prior written approval of the EPA Administrator to construct the facility. To obtain approval, the owner or operator shall provide the EPA Administrator with the following information:

(A) Application to construct pursuant to 40 CFR § 61.07.

(B) In addition to the information requirements of 40 CFR § 61.07(b)(3), a

(I) Description of waste feed handling and temporary storage.

(II) Description of process operating conditions.

(III) Description of the handling and temporary storage of the end product.

(IV) Description of the protocol to be followed when analyzing output materials by transmission electron microscopy.

(C) Performance test protocol, including provisions for obtaining information required under paragraph (r)(ii).

(D) The EPA Administrator may require that a demonstration of the process be performed prior to approval of the application to construct.

(ii) Conduct a Start-up Performance Test. Test Results Shall Include:

(A) A detailed description of the types and quantities of nonasbestos material, RACM, and asbestos-containing waste material processed, e.g., asbestos cement products, friable asbestos insulation, plaster, wood, plastic, wire, etc. Test feed is to include the full range of materials that will be encountered in actual operation of the process.

(B) Results of analyses, using polarized light microscopy, that document the asbestos content of the wastes processed.

(C) Results of analyses, using transmission electron microscopy, that document that the output materials are free of asbestos. Samples for analysis are to be collected as 8-hour composite samples (one 200-gram (7-ounce) sample per hour), beginning with the initial introduction of RACM or asbestos-containing waste material and continuing until the end of the performance test.

(D) A description of operation parameters, such as temperature and residence time, defining the full range over which the process is expected to operate to produce nonasbestos (asbestos-free) materials. Specify the limits for each operating parameter within which the process will produce nonasbestos (asbestos-free) materials.

(E) The length of the test.

(iii) During the initial 90 days of operation,

(A) Continuously monitor and log the operating parameters identified during start-up performance tests that are intended to ensure the production of nonasbestos (asbestos-free) output material.

(B) Monitor input materials to ensure that they are consistent with the test feed materials described during start-up performance tests in paragraph (r)(ii)(A).

(C) Collect and analyze samples, taken as 10-day composite samples (one 200-gram (7-ounce) sample collected every 8 hours of operation) of all output material for the presence of asbestos. Composite samples may be for fewer than 10 days. Transmission electron microscopy (TEM) shall be used to analyze the output material for the presence of asbestos. During the initial 90-day period, all output materials must be stored on-site until analysis shows the material to be asbestos-free or disposed of as asbestos-containing waste material according to paragraph (m).

(iv) After the initial 90 days of operation,

(A) Continuously monitor and record the operating parameters identified during start-up performance testing and any subsequent performance testing. Any output produced during a period of deviation from the range of operating conditions established to ensure the production of nonasbestos (asbestos-free) output materials shall be:

(I) Disposed of as asbestos-containing waste material according to paragraph (m), or

(II) Recycled as waste feed during process operation within the established range of operation conditions, or

(III) Stored temporarily on-site in a leak-tight container until analyzed for asbestos content. Any product material that is not asbestos-free shall be either disposed of as asbestos-containing waste material or recycled as waste feed to the process.

(B) Collect and analyze monthly composite samples (one 200-gram (7-ounce) sample collected every 8 hours of operation) of the output material. Transmission electron microscopy shall be used to analyze the output material for the presence of asbestos.

(v) Discharge no visible emissions to the outside air from any part of the operation, or use the methods specified in paragraph (o) to clean emissions containing particulate asbestos material before they escape to, or are vented to, the outside air.

(vi) Maintain Records On-site and Include the Following Information:

(A) Results of start-up performance testing and all subsequent performance testing, including operating parameters, feed characteristic, and analyses of output materials.

(B) Results of the composite analyses required during the initial 90 days of operation under paragraph (r)(iii).

(C) Results of the monthly composite analyses required under paragraph (r)(iv).

(D) Results of continuous monitoring and logs of process operating parameters required under paragraph (r)(iii) and (iv).

(E) The information on waste shipments received as required in paragraph (q).

(F) For output materials where no analyses were performed to determine the presence of asbestos, record the name and location of the purchaser or disposal site to which the output materials were sold or deposited, and the date of sale or disposal.

(G) Retain records required by paragraph (r)(vi) for at least 2 years.

(vii) Submit the Following Reports to the Administrator:

(A) A report for each analysis of product composite samples performed during the initial 90 days of operation.

(B) A quarterly report, including the following information concerning activities during each consecutive 3-month period:

(I) Results of analyses of monthly product composite samples.

(II) A description of any deviation from the operating parameters established during performance testing, the duration of the deviation, and steps taken to correct the deviation.

(III) Disposition of any product produced during a period of deviation, including whether it was recycled, disposed of as asbestos-containing waste material, or stored temporarily on-site until analyzed for asbestos content.

(IV) The information on waste disposal activities as required in paragraph (q).

(viii) Nonasbestos (asbestos-free) output material is not subject to any of the provisions of this section. Output materials in which asbestos is detected, or output materials produced when the operating parameters deviated from those established during the start-up performance testing, unless shown by TEM analysis to be asbestos-free, shall be considered to be asbestos-containing waste and shall be handled and disposed of according to paragraphs (m) and (q) or reprocessed while all of the established operating parameters are being met.

Section 9. **Incorporation by reference.**

(a) Code of Federal Regulations (CFR). All Code of Federal Regulations (CFR), including their Appendices, cited in this Chapter, revised and published as of July 1, 2008, not including any later amendments, are incorporated by reference. Copies of the Code of Federal Regulations are available for public inspection and copies can be obtained at cost from the Department of Environmental Quality, Division of Air Quality, 122 W. 25th Street, Cheyenne, Wyoming 82002. Copies of the CFRs can also be obtained at cost from Government Institutes, 15200 NBN Way, Building B, Blue Ridge Summit, PA 17214.

(b) American Society for Testing and Materials (ASTM). All ASTM standards cited in this Chapter, revised and published as of July 1, 2008, not including any later amendments, are incorporated by reference. Copies of the ASTM standards are available for public inspection and copies can be obtained at cost from the Department of Environmental Quality, Division of Air Quality, 122 W. 25th Street, Cheyenne, Wyoming 82002. Copies can also be obtained at cost from the American Society for Testing and Materials, 100 Barr Harbor Drive, Post Office Box C700, West Conshohocken, PA 19428-2959.

WYOMING DEPARTMENT OF ENVIRONMENTAL QUALITY
AIR QUALITY DIVISION
STANDARDS AND REGULATIONS

Ambient Standards

CHAPTER 2

Section 1. **Introduction to ambient standards.**

(a) This Chapter establishes standards of ambient air quality necessary to protect public health and welfare. Such standards are subject to revision. The term “ambient air” refers to that portion of the atmosphere, external to buildings, to which the general public has access. Section 12 incorporates by reference all Code of Federal Regulations (CFRs) cited in this chapter, including their Appendices.

Section 2. **Ambient standards for particulate matter.**

(a) PM₁₀: The ambient air standards for PM₁₀ particulate matter are:

(~~iii~~) 150 micrograms per cubic meter--24-hour average concentration with not more than one expected exceedance per year.

(~~iii~~A) Attainment of the ~~annual and~~ 24-hour standards is determined in accordance with Appendix K of 40 CFR part 50.

(ii) 50 micrograms per cubic meter--annual arithmetic mean.

(A) Attainment of the annual standard is determined in accordance with Appendix 1 of this chapter.

(~~iv~~iii) For the purpose of determining attainment of the standards, particulate matter shall be measured in the ambient air as PM₁₀ (particles with an aerodynamic diameter less than or equal to a nominal 10 micrometers), by a reference method based on 40 CFR part 50, Appendix J and designated in accordance with 40 CFR part 53 or an equivalent or alternate method designated in accordance with 40 CFR part 53.

(b) PM_{2.5}: The primary and secondary ambient air quality standards for PM_{2.5} particulate matter are:

(i) 15 micrograms per cubic meter (µg/m³) annual arithmetic mean concentration and:

(ii) ~~65~~ 35 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$)--98th percentile 24-hour average concentration.

(iii) Attainment of the annual and 24-hour standards is determined in accordance with Appendix N of 40 CFR part 50.

(iv) For the purpose of determining attainment of the standards, particulate matter shall be measured in the ambient air as $\text{PM}_{2.5}$ (particles with an aerodynamic diameter less than or equal to a nominal 2.5 micrometers), by a reference method based on 40 CFR part 50, Appendix L and designated in accordance with 40 CFR part 53 or an equivalent or alternate method designated in accordance with 40 CFR part 53.

(c) Ambient air, for the area bounded by Townships 40 through 52 North, and Ranges 69 through 73 West, inclusive, of the Sixth Principal Meridian, Campbell and Converse Counties, in the Powder River Coal Basin, is defined as that portion of the atmosphere, external to buildings, to which the general public has access. For surface mining operations, the application of this definition will be limited to only those lands that are necessary to conduct mining operations as determined by the Administrator of the Wyoming Air Quality Division.

Section 3. **Ambient standards for nitrogen oxides.**

(a) The ambient air standard for nitrogen dioxide, measured by the reference method described in 40 CFR part 50, Appendix F, or by an equivalent method designated in accordance with 40 CFR part 53, is:

(i) 100 micrograms per cubic meter (0.05 ppm)--annual arithmetic mean.

Section 4. **Ambient standards for sulfur oxides.**

(a) The ambient air standards for sulfur oxides measured by the pararosaniline (West-Gaeke) method given in 40 CFR part 50, Appendix A, or an equivalent method designated in accordance with 40 CFR part 53, are:

(i) 60 micrograms per cubic meter (0.02 ppm)--annual arithmetic mean;

(ii) 260 micrograms per cubic meter (0.10 ppm)--maximum 24-hour concentration not to be exceeded more than once per year;

(iii) 1,300 micrograms per cubic meter (0.50 ppm)--maximum 3-hour concentration not to be exceeded more than once per year.

Section 5. Ambient standards for carbon monoxide.

(a) The ambient air standard for carbon monoxide, measured by nondispersive infrared spectrometry, as described in 40 CFR part 50, Appendix C, or by an equivalent method designated in accordance with 40 CFR part 53, is:

(i) 10 milligrams per cubic meter (9 ppm)--maximum 8-hour concentration not to be exceeded more than once per year;

(ii) 40 milligrams per cubic meter (35 ppm)--maximum 1-hour concentration not to be exceeded more than once per year.

Section 6. Ambient standards for ozone.

(a) The level of the 8-hour primary and secondary ambient air quality standards for ozone, measured by a reference method based on 40 CFR part 50, Appendix D and designated in accordance with 40 CFR part 53 is 0.08 parts per million (ppm), daily maximum 8-hour average.

(b) The 8-hour primary and secondary standard ozone ambient air quality standards are met at an ambient air quality monitoring site when the average of the annual fourth-highest daily maximum 8-hour average ozone concentration is less than or equal to 0.08 ppm, as determined in accordance with 40 CFR part 50, Appendix I.

Section 7. Ambient standards for hydrogen sulfide.

(a) The ambient air standards for hydrogen sulfide, measured by the mercuric chloride method, methylene blue method, or by an equivalent method are:

(i) 70 micrograms H₂S per cubic meter, ½-hour average not to be exceeded more than 2 times per year;

(ii) 40 micrograms H₂S per cubic meter, ½-hour average not to be exceeded more than 2 times in any five consecutive days.

Section 8. Ambient standards for suspended sulfates.

(a) The ambient air standards for suspended sulfate measured as a sulfation rate by the lead peroxide method are:

(i) 0.25 milligrams SO₃ per 100 square centimeters per day, maximum annual average;

(ii) 0.50 milligrams SO₃ per 100 square centimeters per day, maximum 30-day value.

Section 9. Ambient standards for fluorides.

(a) The ambient air standards for fluorides, measured as hydrogen fluoride through methods approved by the Administrator are:

(i) Statewide Standard:

Averaging Time	Maximum Allowable Concentration for Averaging Time
12 hours	3.0 µg/m ³
24 hours	1.8 µg/m ³
7 days	0.5 µg/m ³
30 days	0.4 µg/m ³

(ii) Regional Standard:

Averaging Time	Maximum Allowable Concentration for Averaging Time
12 hours	10.0 µg/m ³
24 hours	4.0 µg/m ³
7 days	1.8 µg/m ³
30 days	1.2 µg/m ³

The Regional Standard applies to the area encompassing the following lands in Sweetwater County, Wyoming:

- T19N R104W, E1/2 Section 31 & Sections 32, 33, 34, 35, 36;
- T19N R103W, Section 31;
- T18N R105W, S1/2 Section 1 & Sections 12, 13, 24, 25, 35, 36;
- T18N R104W, All Sections 1 through 36;
- T18N R103W, Sections 6, 7, 18, 19, 30, 31, 32, 33;
- T17N R105W, Sections 1, 2, 11, 12, 13, 14, 23, 24, 25, 26;
- T17N R104W, Sections 1 through 30;
- T17N R103W, Sections 4, 5, 6, 7, 8, 9, 16, 17, 18, 19, 20, 21, 28, 29, 30

(b) The standards for fluoride in forage for animal consumption measured as fluorine, dry weight basis, are:

Averaging Time	Maximum Allowable Concentration for Averaging Time
One year	30 ppm
60 days	60 ppm
30 days	80 ppm

The concentration of fluoride in forage shall be determined through sampling and analysis methods approved by the Administrator.

Section 10. **Ambient standards for lead.**

(a) The primary and secondary ambient air quality standards for lead (Pb) and its compounds, measured as elemental lead by a reference method based upon 40 CFR 50.12 Appendix G or by an equivalent method designated in accordance with 40 CFR part 53 is 1.5 micrograms per cubic meter, maximum arithmetic mean averaged over a calendar quarter. are 0.15 micrograms per cubic meter, arithmetic mean concentration over a 3-month period, measured in the ambient air as Pb either by:

(i) A reference method based on 40 CFR part 50, Appendix G (Reference Method for the Determination of Lead in Suspended Particulate Matter Collected From Ambient Air), and designated in accordance with 40 CFR part 53 or;

(ii) An equivalent method designated in accordance with 40 CFR part 53.

(b) The primary and secondary ambient air quality standards for Pb are met when the maximum arithmetic 3-month mean concentration for a 3-year period, as determined in accordance with Appendix R (Interpretation of the National Ambient Air Quality Standards for Lead) of 40 CFR part 50, is less than or equal to 0.15 micrograms per cubic meter.

Section 11. **Ambient standards for odors.**

(a) The ambient air standard for odors from any source shall be limited to:

(i) An odor emission at the property line which is undetectable at seven dilutions with odor free air as determined by a scentometer as manufactured by the Barnebey-Cheney Company or any other instrument, device, or technique designated by the Division as producing equivalent results. The occurrence of odors shall be measured so that at least two measurements can be made within a period of one hour, these determinations being separated by at least 15 minutes.

(b) No person shall operate or use any device, machine, equipment, or other contrivance for the reduction of animal matter unless all gases, vapors and gas entrained effluents from such facility are incinerated at a temperature of not less than 1200 degrees

Fahrenheit for a period not less than 0.3 second, or processed by condensation or such manner as determined by the Division to be equally or more effective for the purpose of controlling such emissions.

(i) A person incinerating or processing gases, vapors, or gas entrained effluents pursuant to this rule shall provide, properly install, and maintain in good working order and in operation, devices as specified by the Division for indicating temperature, pressure, or other operating conditions.

(ii) Effective odor control devices, systems, or measures shall be installed and operated such that no vent, exhaust pipe, blowoff pipe, or opening of any kind shall discharge into the outdoor air any odorous matter, vapors, gases, or dusts, or any combination thereof, which create odors in areas adjacent to the plant in excess of the limits described in Chapter 2, Section 11(a)(i) of this regulation.

(c) Odor producing materials shall be stored, transported, and handled in a manner that:

(i) Odors produced from such materials are confined and that accumulation of such materials resulting from spillage or other escape is prevented.

(d) Whenever dust, fumes, gases, mist, odorous matter, vapors, or any combination thereof escape from a building used for processing animal matter in such manner and amount as to cause a violation of Subsection (a)(i) of this regulation, the Division may require that the building or buildings in which processing, handling, and storage are done be tightly closed and ventilated in such a manner that all airborne effluent materials leaving the building be treated by an effective means for removal or destruction of odorous matter before release to the open air.

Section 12. Incorporation by reference.

(a) Code of Federal Regulations (CFR). All Code of Federal Regulations (CFRs) cited in this chapter, including their Appendices, revised and published as of July 1, 2008, not including any later amendments, are incorporated by reference. Copies of the Code of Federal Regulations are available for public inspection and copies can be obtained at cost from the Department of Environmental Quality, Division of Air Quality, 122 W. 25th Street, Cheyenne, Wyoming 82002. Copies of the CFRs can also be obtained at cost from Government Institutes, 15200 NBN Way, Building B, Blue Ridge Summit, PA 17214.

APPENDIX 1
INTERPRETATION OF THE ANNUAL STATE
AMBIENT AIR QUALITY STANDARD FOR PM₁₀

1.0 General.

(a) This appendix explains the computations necessary for analyzing particulate matter data to determine attainment of the annual standard. For the primary standard, particulate matter is measured in the ambient air as PM₁₀ (particles with an aerodynamic diameter less than or equal to a nominal 10 micrometers) by a reference method based on 40 CFR part 50, Appendix J, and designated in accordance with 40 CFR part 53, or by an equivalent method designated in accordance with 40 CFR part 53. The required frequency of measurements is specified in 40 CFR part 58.

(b) The terms used in this appendix are defined as follows:

Average refers to an arithmetic mean. The particulate matter standard is expressed in terms of the annual arithmetic mean.

Daily value for PM₁₀ refers to the 24-hour average concentration of PM₁₀ calculated or measured from midnight to midnight (local time).

Expected annual value is the number approached when the annual values from an increasing number of years are averaged, in the absence of long-term trends in emissions or meteorological conditions.

Year refers to a calendar year.

(c) Although the discussion in this appendix focuses on monitored data, the same principles apply to modeling data, subject to EPA modeling guidelines.

2.0 Attainment Determinations.

2.1 Annual Primary Standards.

The annual primary standard is attained when the expected annual arithmetic mean PM₁₀ concentration is less than or equal to the level of the standard. In the simplest case, the expected annual arithmetic mean is determined by averaging the annual arithmetic mean PM₁₀ concentrations for the past 3 calendar years. Because of the potential for incomplete data and the possible seasonality in PM₁₀ concentrations, the annual mean shall be calculated by averaging the four quarterly means of PM₁₀ concentrations within the calendar year. The equations for calculating the annual arithmetic mean are given in Section 3.0 of this appendix. Situations in which 3 years of data are not available and possible adjustments for unusual events or trends are discussed in Sections 2.2 and 2.3 of this appendix. The expected annual arithmetic mean is rounded to the nearest 1 µg/m³ before comparison with the annual standard (fractional values equal to or greater than 0.5 are to be rounded up).

2.2 Data Requirements.

(a) A minimum of 75 percent of the scheduled PM₁₀ samples per quarter are required.

(b) To demonstrate attainment of the annual standard at a monitoring site, the monitor must provide sufficient data to perform the required calculations of Section 3.0 of this appendix. The amount of data required varies with the sampling frequency, data capture rate and the number of years of record. In all cases, 3 years of representative monitoring data that meet the 75 percent criterion of the previous paragraph should be utilized, if available, and would suffice. More than 3 years may be considered, if all additional

representative years of data meeting the 75 percent criterion are utilized. Data not meeting these criteria may also suffice to show attainment; however, such exceptions will have to be approved by the Air Quality Division Administrator.

(c) There are less stringent data requirements for showing that a monitor has failed an attainment test and thus has recorded a violation of the particulate matter standard. Although it is generally necessary to meet the minimum 75 percent data capture requirement per quarter to use the computational equations described in Section 3.0 of this appendix, this criterion does not apply when less data is sufficient to unambiguously establish nonattainment. The following examples illustrate how nonattainment can be demonstrated when a site fails to meet the completeness criteria. Nonattainment of the annual standard can be demonstrated on the basis of quarterly mean concentrations developed from observed data combined with one-half the minimum detectable concentration substituted for missing values. Expected annual values must exceed the levels allowed by the standard.

2.3 Adjustment for Exceptional Events and Trends.

(a) An exceptional event is an uncontrollable event caused by natural sources of particulate matter or an event that is not expected to recur at a given location. Inclusion of such a value in the computation of exceedances or averages could result in inappropriate estimates of their respective expected annual values. To reduce the effect of unusual events, more than 3 years of representative data may be used. Alternatively, other techniques, such as the use of statistical models or the use of historical data could be considered so that the event may be discounted or weighted according to the likelihood that it will recur. The use of such techniques is subject to the approval of the Air Quality Division Administrator.

(b) In cases where long-term trends in emissions and air quality are evident, mathematical techniques should be applied to account for the trends to ensure that the expected annual values are not inappropriately biased by unrepresentative data. In the simplest case, if 3 years of data are available under stable emission conditions, this data should be used. In the event of a trend or shift in emission patterns, either the most recent representative year(s) could be used or statistical techniques or models could be used in conjunction with previous years of data to adjust for trends. The use of less than 3 years of data, and any adjustments are subject to the approval of the Air Quality Division Administrator.

3.0 Computational Equations for Annual Standard.

3.1 Calculation of the Annual Arithmetic Mean.

(a) An annual arithmetic mean value for PM_{10} is determined by averaging the quarterly means for the 4 calendar quarters of the year. The following equation is to be used for calculation of the mean for a calendar quarter:

Equation 1

$$\bar{x}_q = (1/n_q) \times \sum_{i=1}^{n_q} x_i$$

where:

\bar{x}_q = the quarterly mean concentration for quarter q, q=1, 2, 3, or 4,

n_q = the number of samples in the quarter, and

x_i = the i th concentration value recorded in the quarter.

(b) The quarterly mean, expressed in $\mu\text{g}/\text{m}^3$, must be rounded to the nearest tenth (fractional values of 0.05 should be rounded up).

(c) The annual mean is calculated by using the following equation:

Equation 2

$$\bar{x} = (1/4) \times \sum_{q=1}^4 \bar{x}_q$$

where:

\bar{x} = the annual mean; and

\bar{x}_q = the mean for calendar quarter q.

(d) The average of quarterly means must be rounded to the nearest tenth (fractional values of 0.05 should be rounded up).

(e) The use of quarterly averages to compute the annual average will not be necessary for monitoring or modeling data which results in a complete record, i.e., 365 days per year.

(f) The expected annual mean is estimated as the average of three or more annual means. This multi-year estimate, expressed in $\mu\text{g}/\text{m}^3$, shall be rounded to the nearest integer for comparison with the annual standard (fractional values of 0.5 should be rounded up).

Example 1

Using Equation 1, the quarterly means are calculated for each calendar quarter. If the quarterly means are 52.4, 75.3, 82.1, and 63.2 $\mu\text{g}/\text{m}^3$, then the annual mean is:

$$\bar{X} = (1/4) \times (52.4 + 75.3 + 82.1 + 63.2) = 68.25 \text{ or } 68.3.$$

3.2 Adjustments for Non-scheduled Sampling Days.

(a) An adjustment in the calculation of the annual mean is needed if sampling is performed on days in addition to the days specified by the systematic sampling schedule. The quarterly averages would be calculated by using the following equation:

Equation 3

$$\bar{x}_q = \left(1/m_q\right) \times \sum_{j=1}^{m_q} \sum_{i=1}^{k_j} (x_{ij}/k_j)$$

where:

\bar{x}_q = the quarterly mean concentration for quarter q, q=1, 2, 3, or 4;

x_{ij} = the *i*th concentration value recorded in stratum *j*;

k_j = the number of actual samples in stratum *j*; and

m_q = the number of strata with data in the quarter.

(b) If one sample value is recorded in each stratum, Equation 3 reduces to a simple arithmetic average of the observed values as described by Equation 1.

Example 2

a. During one calendar quarter, 9 observations were recorded. These samples were distributed among 7 sampling strata, with 3 observations in one stratum. The concentrations of the 3 observations in the single stratum were 202, 242, and 180 $\mu\text{g}/\text{m}^3$. The remaining 6 observed concentrations were 55, 68, 73, 92, 120, and 155 $\mu\text{g}/\text{m}^3$. Applying the weighting factors specified in Equation 3, the quarterly mean is:

$$\bar{X}_q = (1/7) \times [(1/3) \times (202 + 242 + 180) + 155 + 68 + 73 + 92 + 120 + 155] = 110.1$$

b. Note that these values are rounded to the nearest 1 $\mu\text{g}/\text{m}^3$ for the calculation of means.

**WYOMING DEPARTMENT OF ENVIRONMENTAL QUALITY
AIR QUALITY DIVISION
STANDARDS AND REGULATIONS**

Ambient Standards

CHAPTER 2

Section 1. Introduction to ambient standards.

(a) This Chapter establishes standards of ambient air quality necessary to protect public health and welfare. Such standards are subject to revision. The term “ambient air” refers to that portion of the atmosphere, external to buildings, to which the general public has access. Section 12 incorporates by reference all Code of Federal Regulations (CFRs) cited in this chapter, including their Appendices.

Section 2. Ambient standards for particulate matter.

(a) PM₁₀: The ambient air standards for PM₁₀ particulate matter are:

(i) 150 micrograms per cubic meter--24-hour average concentration with not more than one expected exceedance per year.

(A) Attainment of the 24-hour standard is determined in accordance with Appendix K of 40 CFR part 50.

(ii) 50 micrograms per cubic meter--annual arithmetic mean.

(A) Attainment of the annual standard is determined in accordance with Appendix 1 of this chapter.

(iii) For the purpose of determining attainment of the standards, particulate matter shall be measured in the ambient air as PM₁₀ (particles with an aerodynamic diameter less than or equal to a nominal 10 micrometers), by a reference method based on 40 CFR part 50, Appendix J and designated in accordance with 40 CFR part 53 or an equivalent or alternate method designated in accordance with 40 CFR part 53.

(b) PM_{2.5}: The primary and secondary ambient air quality standards for PM_{2.5} particulate matter are:

(i) 15 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$) annual arithmetic mean concentration and;

(ii) 35 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$)--98th percentile 24-hour average concentration.

(iii) Attainment of the annual and 24-hour standards is determined in accordance with Appendix N of 40 CFR part 50.

(iv) For the purpose of determining attainment of the standards, particulate matter shall be measured in the ambient air as $\text{PM}_{2.5}$ (particles with an aerodynamic diameter less than or equal to a nominal 2.5 micrometers), by a reference method based on 40 CFR part 50, Appendix L and designated in accordance with 40 CFR part 53 or an equivalent or alternate method designated in accordance with 40 CFR part 53.

(c) Ambient air, for the area bounded by Townships 40 through 52 North, and Ranges 69 through 73 West, inclusive, of the Sixth Principal Meridian, Campbell and Converse Counties, in the Powder River Coal Basin, is defined as that portion of the atmosphere, external to buildings, to which the general public has access. For surface mining operations, the application of this definition will be limited to only those lands that are necessary to conduct mining operations as determined by the Administrator of the Wyoming Air Quality Division.

Section 3. **Ambient standards for nitrogen oxides.**

(a) The ambient air standard for nitrogen dioxide, measured by the reference method described in 40 CFR part 50, Appendix F, or by an equivalent method designated in accordance with 40 CFR part 53, is:

(i) 100 micrograms per cubic meter (0.05 ppm)--annual arithmetic mean.

Section 4. **Ambient standards for sulfur oxides.**

(a) The ambient air standards for sulfur oxides measured by the pararosaniline (West-Gaeke) method given in 40 CFR part 50, Appendix A, or an equivalent method designated in accordance with 40 CFR part 53, are:

(i) 60 micrograms per cubic meter (0.02 ppm)--annual arithmetic mean;

(ii) 260 micrograms per cubic meter (0.10 ppm)--maximum 24-hour concentration not to be exceeded more than once per year;

(iii) 1,300 micrograms per cubic meter (0.50 ppm)--maximum 3-hour concentration not to be exceeded more than once per year.

Section 5. Ambient standards for carbon monoxide.

(a) The ambient air standard for carbon monoxide, measured by nondispersive infrared spectrometry, as described in 40 CFR part 50, Appendix C, or by an equivalent method designated in accordance with 40 CFR part 53, is:

(i) 10 milligrams per cubic meter (9 ppm)--maximum 8-hour concentration not to be exceeded more than once per year;

(ii) 40 milligrams per cubic meter (35 ppm)--maximum 1-hour concentration not to be exceeded more than once per year.

Section 6. Ambient standards for ozone.

(a) The level of the 8-hour primary and secondary ambient air quality standards for ozone, measured by a reference method based on 40 CFR part 50, Appendix D and designated in accordance with 40 CFR part 53 is 0.08 parts per million (ppm), daily maximum 8-hour average.

(b) The 8-hour primary and secondary standard ozone ambient air quality standards are met at an ambient air quality monitoring site when the average of the annual fourth-highest daily maximum 8-hour average ozone concentration is less than or equal to 0.08 ppm, as determined in accordance with 40 CFR part 50, Appendix I.

Section 7. Ambient standards for hydrogen sulfide.

(a) The ambient air standards for hydrogen sulfide, measured by the mercuric chloride method, methylene blue method, or by an equivalent method are:

(i) 70 micrograms H₂S per cubic meter, ½-hour average not to be exceeded more than 2 times per year;

(ii) 40 micrograms H₂S per cubic meter, ½-hour average not to be exceeded more than 2 times in any five consecutive days.

Section 8. Ambient standards for suspended sulfates.

(a) The ambient air standards for suspended sulfate measured as a sulfation rate by the lead peroxide method are:

(i) 0.25 milligrams SO₃ per 100 square centimeters per day, maximum annual average;

(ii) 0.50 milligrams SO₃ per 100 square centimeters per day, maximum 30-day value.

Section 9. Ambient standards for fluorides.

(a) The ambient air standards for fluorides, measured as hydrogen fluoride through methods approved by the Administrator are:

(i) Statewide Standard:

Averaging Time	Maximum Allowable Concentration for Averaging Time
12 hours	3.0 $\mu\text{g}/\text{m}^3$
24 hours	1.8 $\mu\text{g}/\text{m}^3$
7 days	0.5 $\mu\text{g}/\text{m}^3$
30 days	0.4 $\mu\text{g}/\text{m}^3$

(ii) Regional Standard:

Averaging Time	Maximum Allowable Concentration for Averaging Time
12 hours	10.0 $\mu\text{g}/\text{m}^3$
24 hours	4.0 $\mu\text{g}/\text{m}^3$
7 days	1.8 $\mu\text{g}/\text{m}^3$
30 days	1.2 $\mu\text{g}/\text{m}^3$

The Regional Standard applies to the area encompassing the following lands in Sweetwater County, Wyoming:

T19N R104W, E1/2 Section 31 & Sections 32, 33, 34, 35, 36;
T19N R103W, Section 31;
T18N R105W, S1/2 Section 1 & Sections 12, 13, 24, 25, 35, 36;
T18N R104W, All Sections 1 through 36;
T18N R103W, Sections 6, 7, 18, 19, 30, 31, 32, 33;
T17N R105W, Sections 1, 2, 11, 12, 13, 14, 23, 24, 25, 26;
T17N R104W, Sections 1 through 30;
T17N R103W, Sections 4, 5, 6, 7, 8, 9, 16, 17, 18, 19, 20, 21, 28, 29, 30

(b) The standards for fluoride in forage for animal consumption measured as fluorine, dry weight basis, are:

Averaging Time	Maximum Allowable Concentration for Averaging Time
One year	30 ppm
60 days	60 ppm
30 days	80 ppm

The concentration of fluoride in forage shall be determined through sampling and analysis methods approved by the Administrator.

Section 10. Ambient standards for lead.

(a) The primary and secondary ambient air quality standards for lead (Pb) and its compounds are 0.15 micrograms per cubic meter, arithmetic mean concentration over a 3-month period, measured in the ambient air as Pb either by:

(i) A reference method based on 40 CFR part 50, Appendix G (Reference Method for the Determination of Lead in Suspended Particulate Matter Collected From Ambient Air), and designated in accordance with 40 CFR part 53 or;

(ii) An equivalent method designated in accordance with 40 CFR part 53.

(b) The primary and secondary ambient air quality standards for Pb are met when the maximum arithmetic 3-month mean concentration for a 3-year period, as determined in accordance with Appendix R (Interpretation of the National Ambient Air Quality Standards for Lead) of 40 CFR part 50, is less than or equal to 0.15 micrograms per cubic meter.

Section 11. Ambient standards for odors.

(a) The ambient air standard for odors from any source shall be limited to:

(i) An odor emission at the property line which is undetectable at seven dilutions with odor free air as determined by a scentometer as manufactured by the Barnebey-Cheney Company or any other instrument, device, or technique designated by the Division as producing equivalent results. The occurrence of odors shall be measured so that at least two measurements can be made within a period of one hour, these determinations being separated by at least 15 minutes.

(b) No person shall operate or use any device, machine, equipment, or other contrivance for the reduction of animal matter unless all gases, vapors and gas entrained effluents from such facility are incinerated at a temperature of not less than 1200 degrees Fahrenheit for a period not less than 0.3 second, or processed by condensation or such manner as determined by the Division to be equally or more effective for the purpose of controlling such emissions.

(i) A person incinerating or processing gases, vapors, or gas entrained effluents pursuant to this rule shall provide, properly install, and maintain in good working order and in operation, devices as specified by the Division for indicating temperature, pressure, or other operating conditions.

(ii) Effective odor control devices, systems, or measures shall be installed and operated such that no vent, exhaust pipe, blowoff pipe, or opening of any kind shall discharge into the outdoor air any odorous matter, vapors, gases, or dusts, or any combination thereof, which create odors in areas adjacent to the plant in excess of the limits described in Chapter 2, Section 11(a)(i) of this regulation.

(c) Odor producing materials shall be stored, transported, and handled in a manner that:

(i) Odors produced from such materials are confined and that accumulation of such materials resulting from spillage or other escape is prevented.

(d) Whenever dust, fumes, gases, mist, odorous matter, vapors, or any combination thereof escape from a building used for processing animal matter in such manner and amount as to cause a violation of Subsection (a)(i) of this regulation, the Division may require that the building or buildings in which processing, handling, and storage are done be tightly closed and ventilated in such a manner that all airborne effluent materials leaving the building be treated by an effective means for removal or destruction of odorous matter before release to the open air.

Section 12. **Incorporation by reference.**

(a) Code of Federal Regulations (CFR). All Code of Federal Regulations (CFRs) cited in this chapter, including their Appendices, revised and published as of July 1, 2008, not including any later amendments, are incorporated by reference. Copies of the Code of Federal Regulations are available for public inspection and copies can be obtained at cost from the Department of Environmental Quality, Division of Air Quality, 122 W. 25th Street, Cheyenne, Wyoming 82002. Copies of the CFRs can also be obtained at cost from Government Institutes, 15200 NBN Way, Building B, Blue Ridge Summit, PA 17214.

APPENDIX 1
INTERPRETATION OF THE ANNUAL STATE
AMBIENT AIR QUALITY STANDARD FOR PM₁₀

1.0 *General.*

(a) This appendix explains the computations necessary for analyzing particulate matter data to determine attainment of the annual standard. For the primary standard, particulate matter is measured in the ambient air as PM₁₀ (particles with an aerodynamic diameter less than or equal to a nominal 10 micrometers) by a reference method based on 40 CFR part 50, Appendix J, and designated in accordance with 40 CFR part 53, or by an equivalent method designated in accordance with 40 CFR part 53. The required frequency of measurements is specified in 40 CFR part 58.

(b) The terms used in this appendix are defined as follows:

Average refers to an arithmetic mean. The particulate matter standard is expressed in terms of the annual arithmetic mean.

Daily value for PM₁₀ refers to the 24-hour average concentration of PM₁₀ calculated or measured from midnight to midnight (local time).

Expected annual value is the number approached when the annual values from an increasing number of years are averaged, in the absence of long-term trends in emissions or meteorological conditions.

Year refers to a calendar year.

(c) Although the discussion in this appendix focuses on monitored data, the same principles apply to modeling data, subject to EPA modeling guidelines.

2.0 *Attainment Determinations.*

2.1 *Annual Primary Standard.*

The annual primary standard is attained when the expected annual arithmetic mean PM₁₀ concentration is less than or equal to the level of the standard. In the simplest case, the expected annual arithmetic mean is determined by averaging the annual arithmetic mean PM₁₀ concentrations for the past 3 calendar years. Because of the potential for incomplete data and the possible seasonality in PM₁₀ concentrations, the annual mean shall be calculated by averaging the four quarterly means of PM₁₀ concentrations within the calendar year. The equations for calculating the annual arithmetic mean are given in Section 3.0 of this appendix. Situations in which 3 years of data are not available and possible adjustments for unusual events or trends are discussed in Sections 2.2 and 2.3 of this appendix. The expected annual arithmetic mean is rounded to the nearest 1 µg/m³ before comparison with the annual standard (fractional values equal to or greater than 0.5 are to be rounded up).

2.2 *Data Requirements.*

(a) A minimum of 75 percent of the scheduled PM₁₀ samples per quarter are required.

(b) To demonstrate attainment of the annual standard at a monitoring site, the monitor must provide sufficient data to perform the required calculations of Section 3.0 of this appendix. The amount of data required varies with the sampling frequency, data capture rate and the number of years of record. In all cases, 3 years of representative monitoring data that meet the 75 percent criterion of the previous paragraph should be utilized, if available, and would suffice. More than 3 years may be considered, if all additional

representative years of data meeting the 75 percent criterion are utilized. Data not meeting these criteria may also suffice to show attainment; however, such exceptions will have to be approved by the Air Quality Division Administrator.

(c) There are less stringent data requirements for showing that a monitor has failed an attainment test and thus has recorded a violation of the particulate matter standard.

Although it is generally necessary to meet the minimum 75 percent data capture requirement per quarter to use the computational equations described in Section 3.0 of this appendix, this criterion does not apply when less data is sufficient to unambiguously establish nonattainment. The following examples illustrate how nonattainment can be demonstrated when a site fails to meet the completeness criteria. Nonattainment of the annual standard can be demonstrated on the basis of quarterly mean concentrations developed from observed data combined with one-half the minimum detectable concentration substituted for missing values. Expected annual values must exceed the levels allowed by the standard.

2.3 Adjustment for Exceptional Events and Trends.

(a) An exceptional event is an uncontrollable event caused by natural sources of particulate matter or an event that is not expected to recur at a given location. Inclusion of such a value in the computation of exceedances or averages could result in inappropriate estimates of their respective expected annual values. To reduce the effect of unusual events, more than 3 years of representative data may be used. Alternatively, other techniques, such as the use of statistical models or the use of historical data could be considered so that the event may be discounted or weighted according to the likelihood that it will recur. The use of such techniques is subject to the approval of the Air Quality Division Administrator.

(b) In cases where long-term trends in emissions and air quality are evident, mathematical techniques should be applied to account for the trends to ensure that the expected annual values are not inappropriately biased by unrepresentative data. In the simplest case, if 3 years of data are available under stable emission conditions, this data should be used. In the event of a trend or shift in emission patterns, either the most recent representative year(s) could be used or statistical techniques or models could be used in conjunction with previous years of data to adjust for trends. The use of less than 3 years of data, and any adjustments are subject to the approval of the Air Quality Division Administrator.

3.0 Computational Equations for Annual Standard.

3.1 Calculation of the Annual Arithmetic Mean.

(a) An annual arithmetic mean value for PM_{10} is determined by averaging the quarterly means for the 4 calendar quarters of the year. The following equation is to be used for calculation of the mean for a calendar quarter:

Equation 1

$$\bar{x}_q = (1/n_q) \times \sum_{i=1}^{n_q} x_i$$

where:

\bar{x}_q = the quarterly mean concentration for quarter q, q=1, 2, 3, or 4,
 n_q = the number of samples in the quarter,
and
 x_i = the *i*th concentration value recorded in the quarter.

- (b) The quarterly mean, expressed in $\mu\text{g}/\text{m}^3$, must be rounded to the nearest tenth (fractional values of 0.05 should be rounded up).
(c) The annual mean is calculated by using the following equation:

Equation 2

$$\bar{x} = (1/4) \times \sum_{q=1}^4 \bar{x}_q$$

where:

\bar{x} = the annual mean; and
 \bar{x}_q = the mean for calendar quarter q.

- (d) The average of quarterly means must be rounded to the nearest tenth (fractional values of 0.05 should be rounded up).
(e) The use of quarterly averages to compute the annual average will not be necessary for monitoring or modeling data which results in a complete record, i.e., 365 days per year.
(f) The expected annual mean is estimated as the average of three or more annual means. This multi-year estimate, expressed in $\mu\text{g}/\text{m}^3$, shall be rounded to the nearest integer for comparison with the annual standard (fractional values of 0.5 should be rounded up).

Example 1

Using Equation 1, the quarterly means are calculated for each calendar quarter. If the quarterly means are 52.4, 75.3, 82.1, and 63.2 $\mu\text{g}/\text{m}^3$, then the annual mean is:

$$\bar{X} = (1/4) \times (52.4 + 75.3 + 82.1 + 63.2) = 68.25 \text{ or } 68.3.$$

3.2 Adjustments for Non-scheduled Sampling Days.

- (a) An adjustment in the calculation of the annual mean is needed if sampling is performed on days in addition to the days specified by the systematic sampling schedule. The quarterly averages would be calculated by using the following equation:

Equation 3

$$\bar{x}_q = \left(1/m_q\right) \times \sum_{j=1}^{m_q} \sum_{i=1}^{k_j} (x_{ij}/k_j)$$

where:

\bar{x}_q = the quarterly mean concentration for quarter q, q=1, 2, 3, or 4;

x_{ij} = the *i*th concentration value recorded in stratum *j*;

k_j = the number of actual samples in stratum *j*; and

m_q = the number of strata with data in the quarter.

(b) If one sample value is recorded in each stratum, Equation 3 reduces to a simple arithmetic average of the observed values as described by Equation 1.

Example 2

a. During one calendar quarter, 9 observations were recorded. These samples were distributed among 7 sampling strata, with 3 observations in one stratum. The concentrations of the 3 observations in the single stratum were 202, 242, and 180 $\mu\text{g}/\text{m}^3$. The remaining 6 observed concentrations were 55, 68, 73, 92, 120, and 155 $\mu\text{g}/\text{m}^3$. Applying the weighting factors specified in Equation 3, the quarterly mean is:

$$\bar{X}_q = (1/7) \times [(1/3) \times (202 + 242 + 180) + 155 + 68 + 73 + 92 + 120 + 155] = 110.1$$

b. Note that these values are rounded to the nearest 1 $\mu\text{g}/\text{m}^3$ for the calculation of means.
